Dashboard

- Management dashboard (1/2): top

Risks

- Risk register
- Risk detail
- Risk form and assessment
- Treatment actions

Incidents and losses

- Incidents and near misses
- Incident form

Reports

- Reports and exports

Governance and compliance

- Key risk indicators (KRIs)
- Risk appetite
- Compliance obligations
- Committee decisions
- Policies and versions
- Risk and control self-assessment (RCSA)

Administration

- Risk assessment scales
- Users and organisation
- Departments
- Branches
- Risk categories (conventional and Islamic)
- Reporting periods
- Settings and currency
- Audit log
- System status and migrations

Reference

- Roles and permissions
- Main workflows
- Arabic, English and mobile
- Limits and verification

Roles and permissions

Role	Data scope	Main permissions
System administrator	All	Users, structure, scales, settings, audit log
Risk manager	All	Risks, incidents, scales, KRIs, appetite, committees, RCSA
Compliance officer	All	Risks, incidents, obligations, committees, policies
Department manager	Own department	Risks and incidents, KRI readings, own-department obligations, RCSA
Branch liaison officer	Own branch	Risks and incidents for the branch, RCSA, read policies
Executive viewer	All	Read-only + export
Auditor	All	Read-only + audit log

> Permissions are enforced on the server for every route and record; opening a direct link to an out-of-scope record returns “not found” (404). Exports, printing and attachments follow the same rules.

What you see

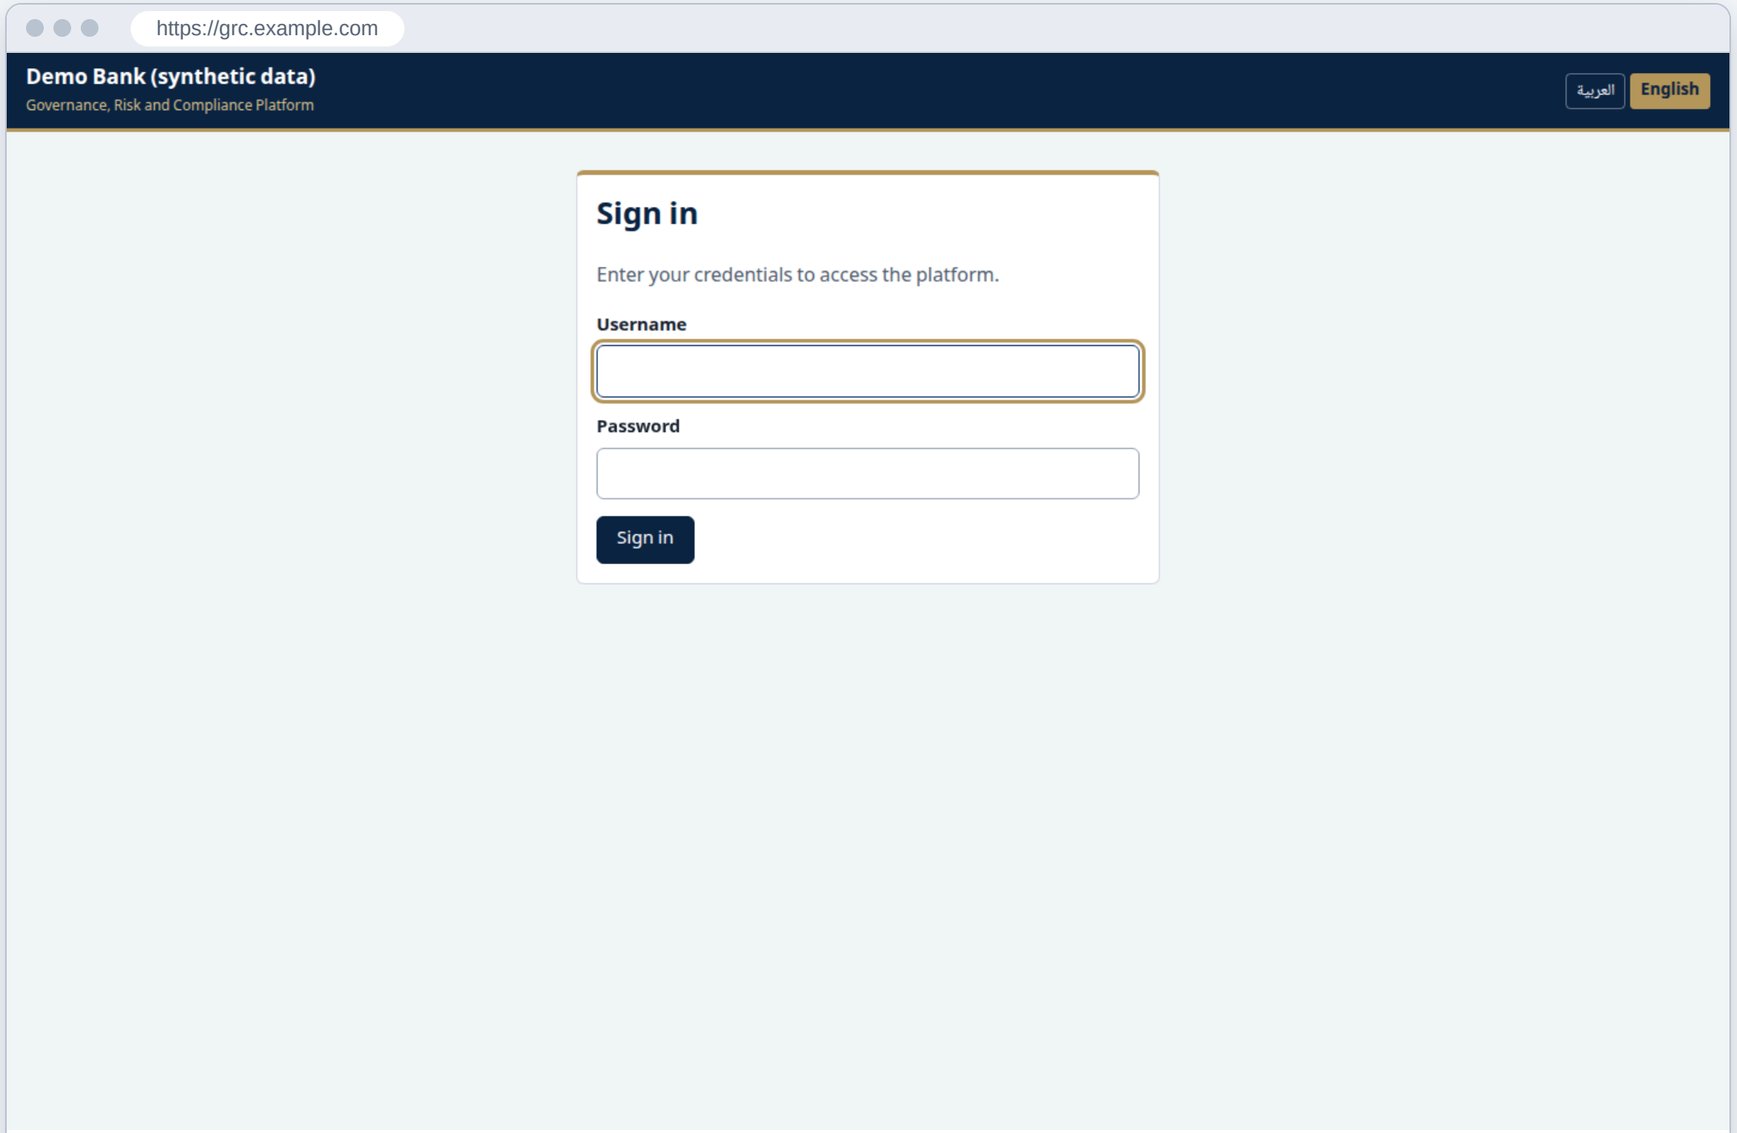

Arabic/English sign-in with the language switch at the top. There are no default accounts: the first administrator is created by the setup wizard.

How to use it

- Enter username and password.
- After 5 failed attempts in 15 minutes sign-in is locked temporarily (no cron needed).
- First sign-in with a temporary password forces a change (12+ characters, letters + a digit).

Permissions and notes

All roles. Sessions expire after 30 minutes idle; the session ID is regenerated at sign-in.

What you see

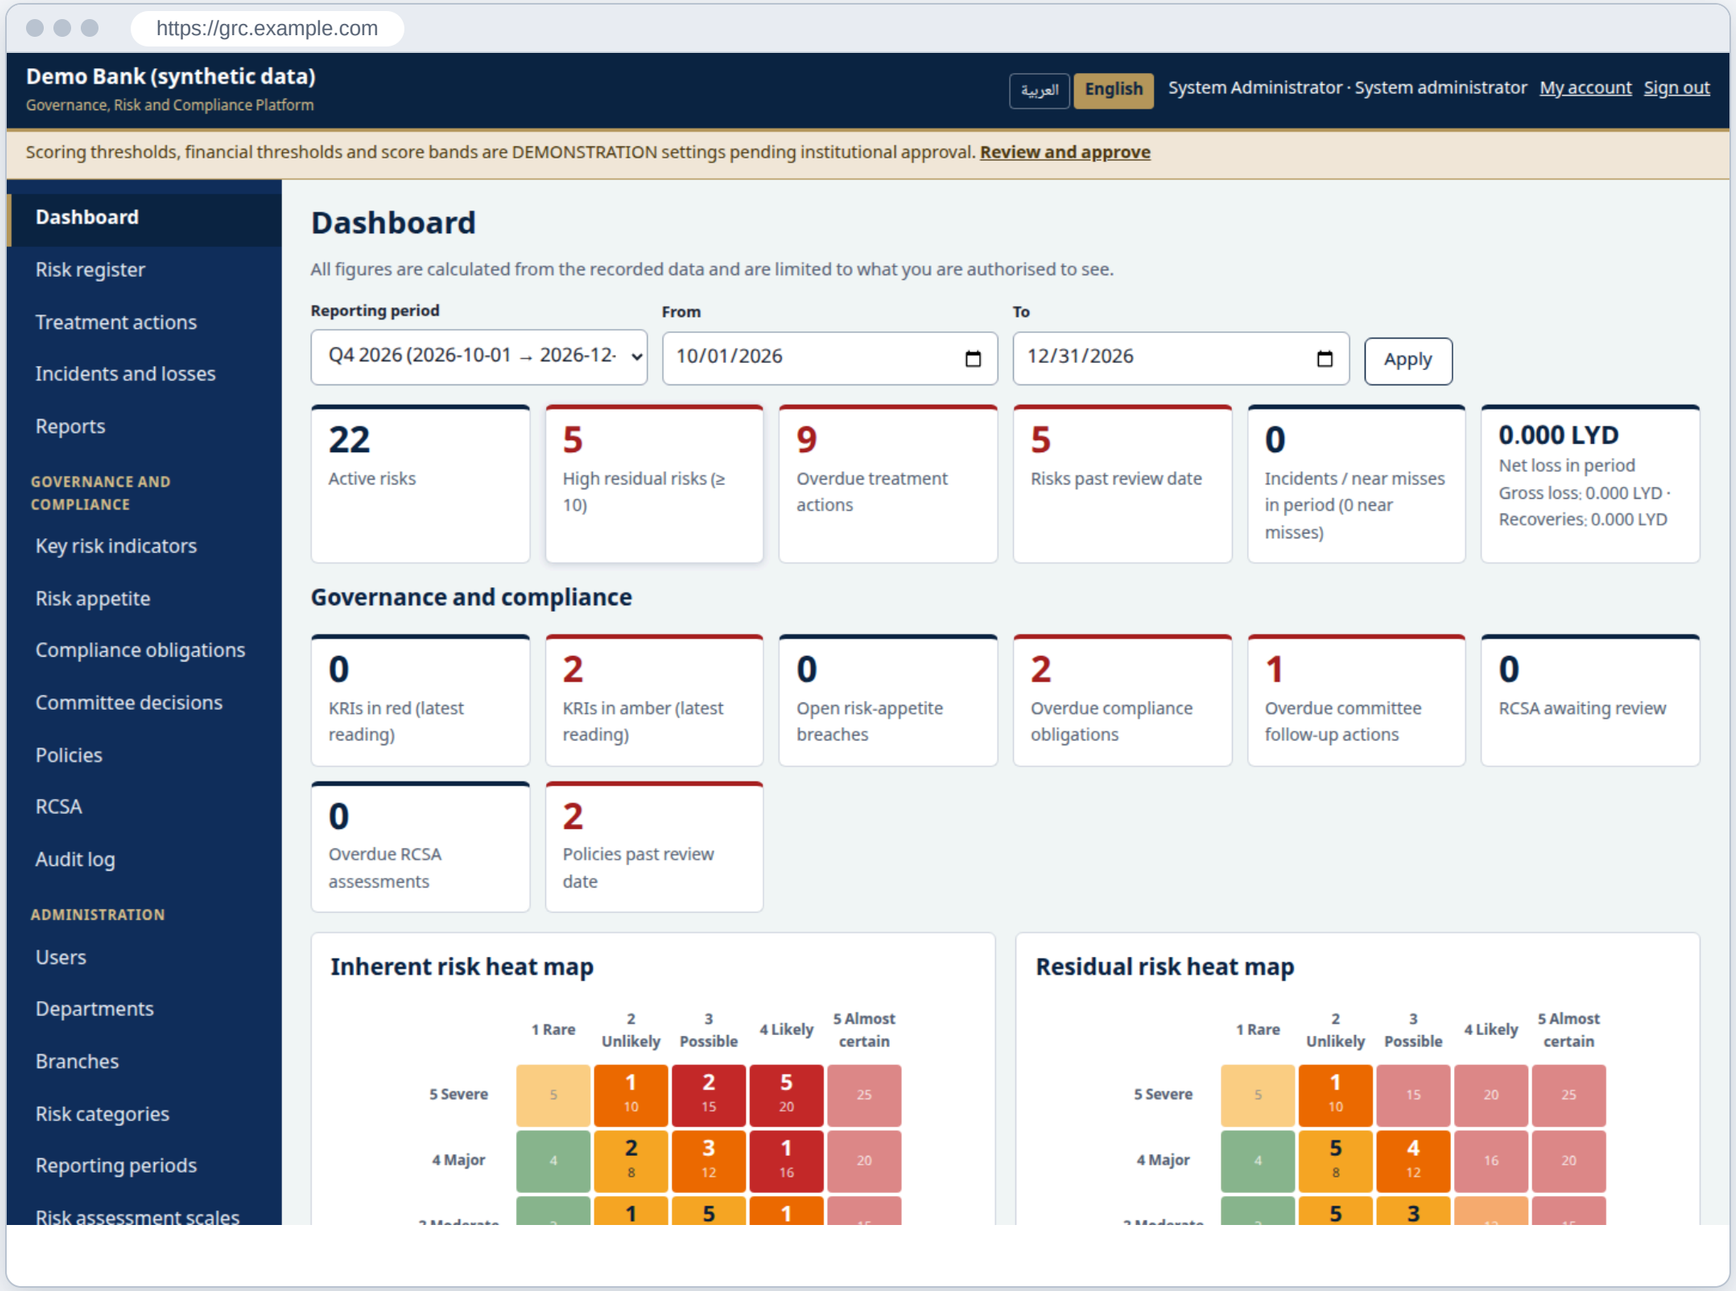

Headline indicators, inherent and residual 5×5 heat maps, active risks by category, department and branch, top residual risks, overdue treatment actions and period losses.

How to use it

- Pick a reporting period or a date range, then Apply.
- Click a heat-map cell, bar or indicator to open the records behind the number.
- Every figure is computed from the database; nothing is decorative.

Permissions and notes

Figures are automatically limited to the user's department/branch. The Governance and compliance strip appears only for authorised roles.

Management dashboard (2/2): charts and lists

Dashboard

What you see

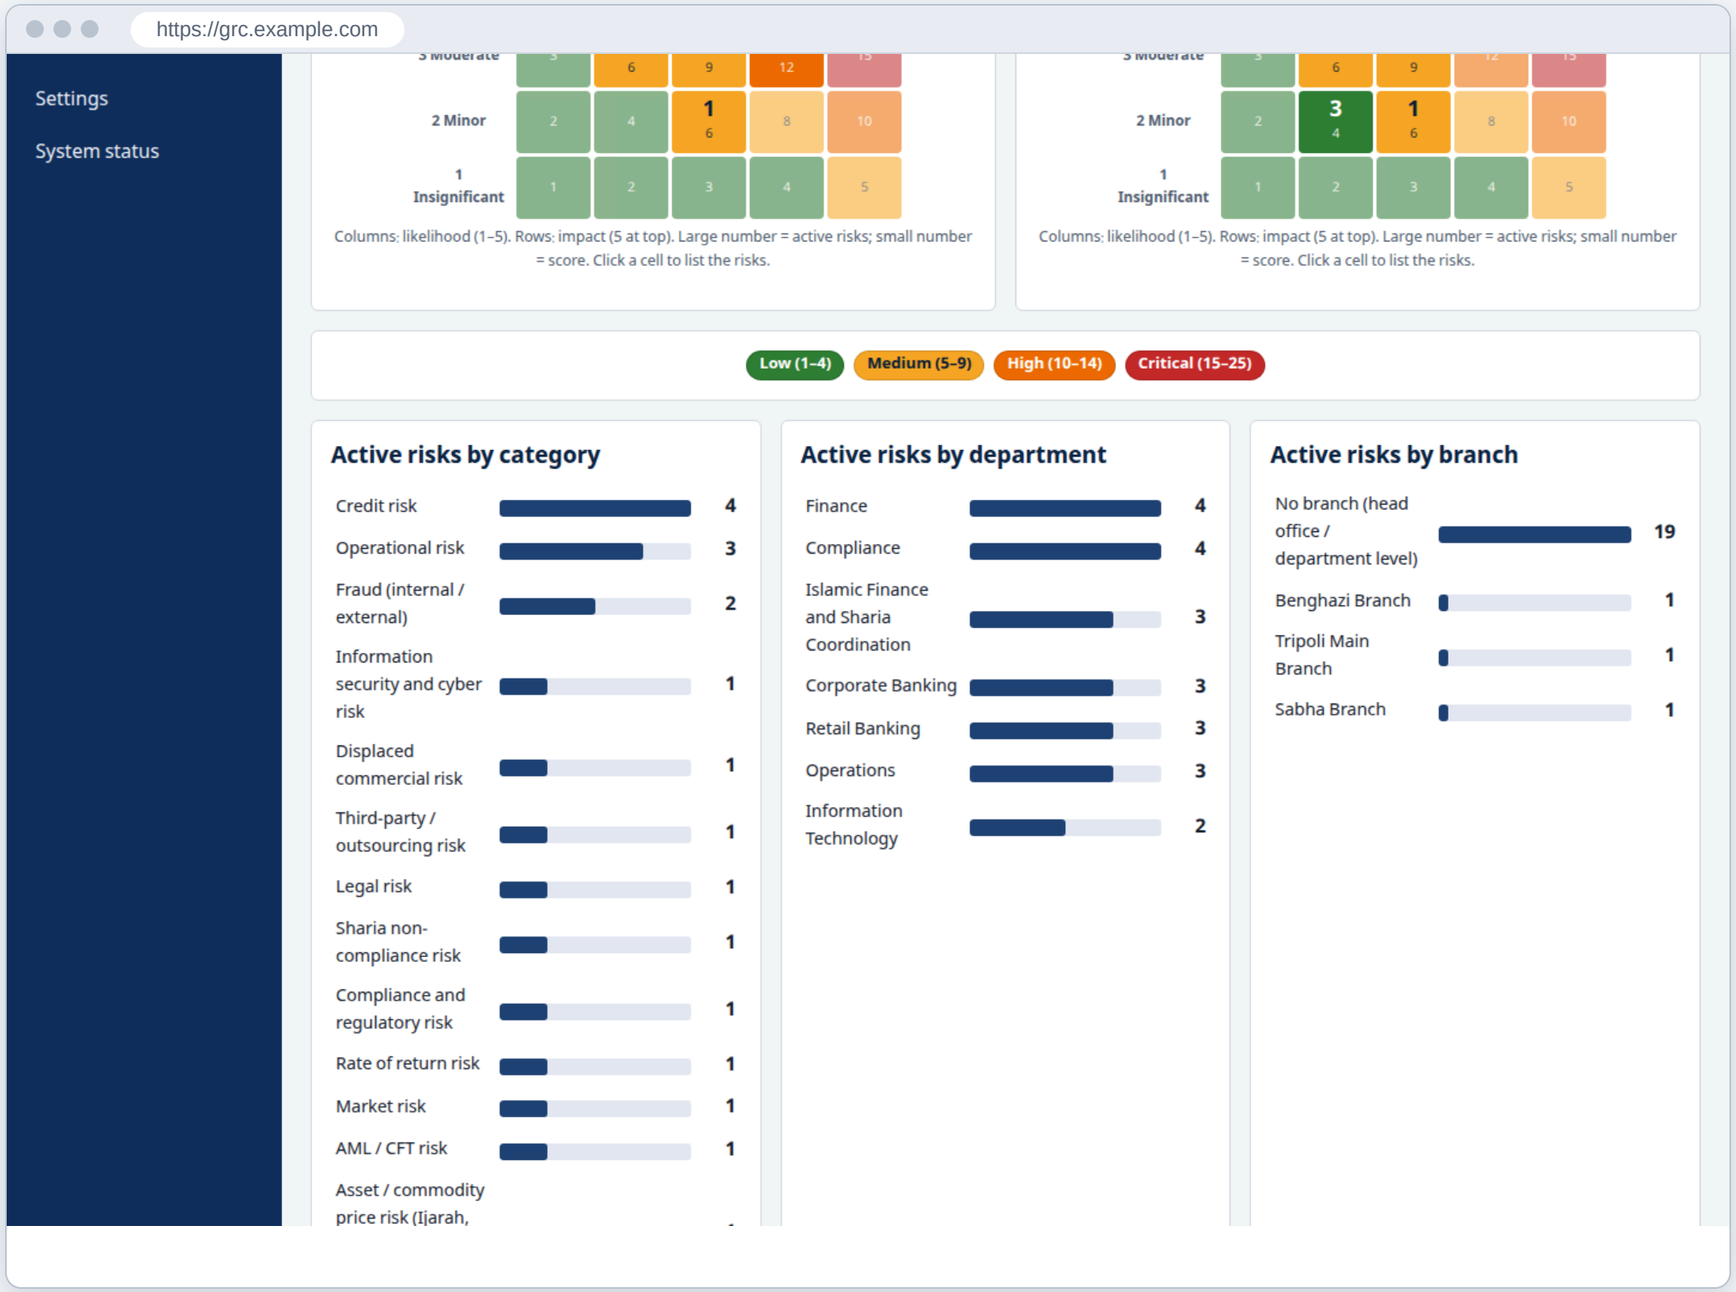

Lower part of the dashboard: heat maps, distributions by category, department and branch, top residual risks, overdue actions and period losses.

How to use it

- Click a heat-map cell to open the risks with that likelihood and impact.
- Click any bar to open the matching records.
- Figures depend on the selected period and the user’s permissions.

Permissions and notes

Figures are automatically limited to the user’s department/branch. The Governance and compliance strip appears only for authorised roles.

What you see

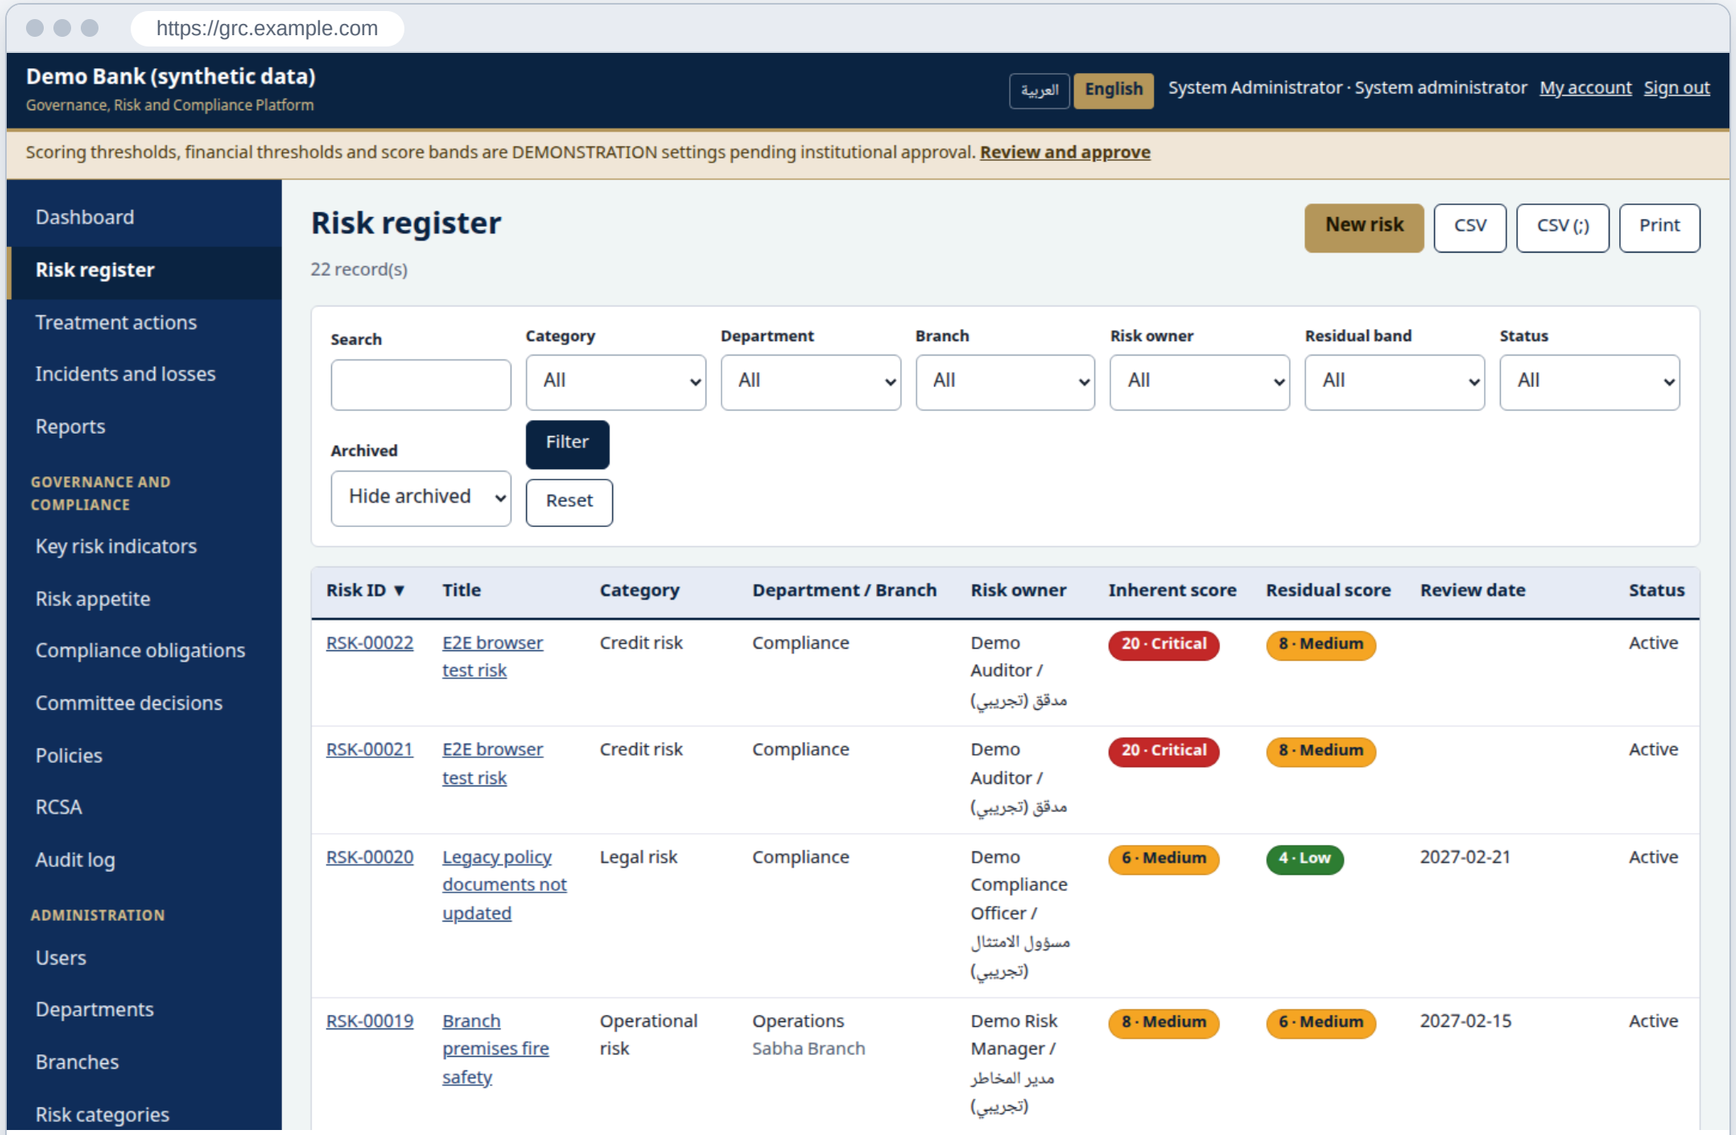

Risk list with text search (Arabic supported) and filters by category, department, branch, owner, score band, status and archive state; sortable columns.

How to use it

- Use Filter, then Reset.
- CSV, CSV (;) and Print apply the same filters.
- An “Overdue” badge means the review date has passed.

Permissions and notes

A department manager sees their department only; a branch liaison sees their branch only. Out-of-scope records return 404.

What you see

Risk card: identification, inherent and residual scores (likelihood × impact) in band colour, controls, treatment decision, treatment actions, attachments, linked incidents and field-level change history.

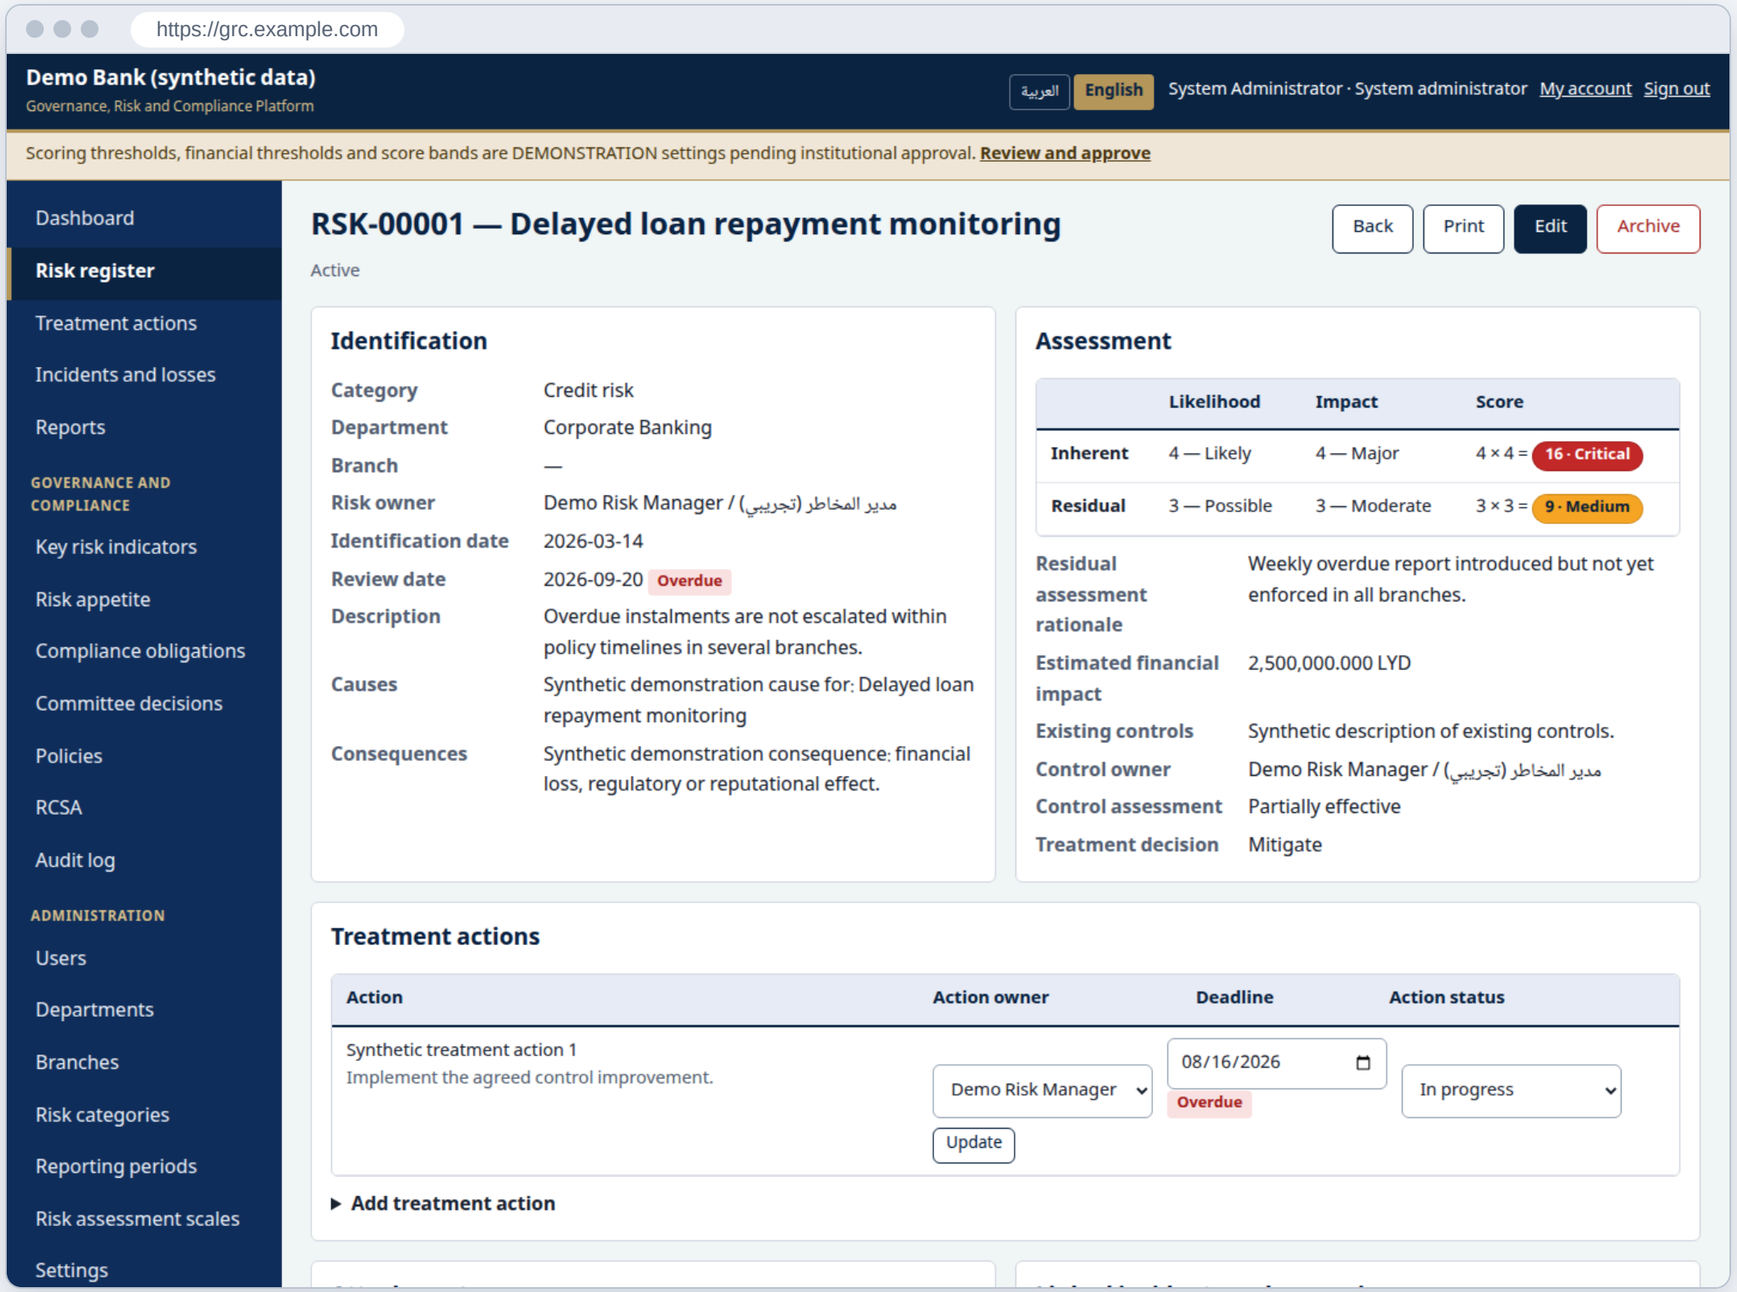

How to use it

- Edit opens the form; Print gives a risk sheet; Archive replaces deletion.
- Add a treatment action (owner, deadline, status).
- Attach pdf/png/jpg/txt/docx/xlsx up to 5 MB.

Permissions and notes

Editing needs the permission and scope.

Archived records are read-only.

What you see

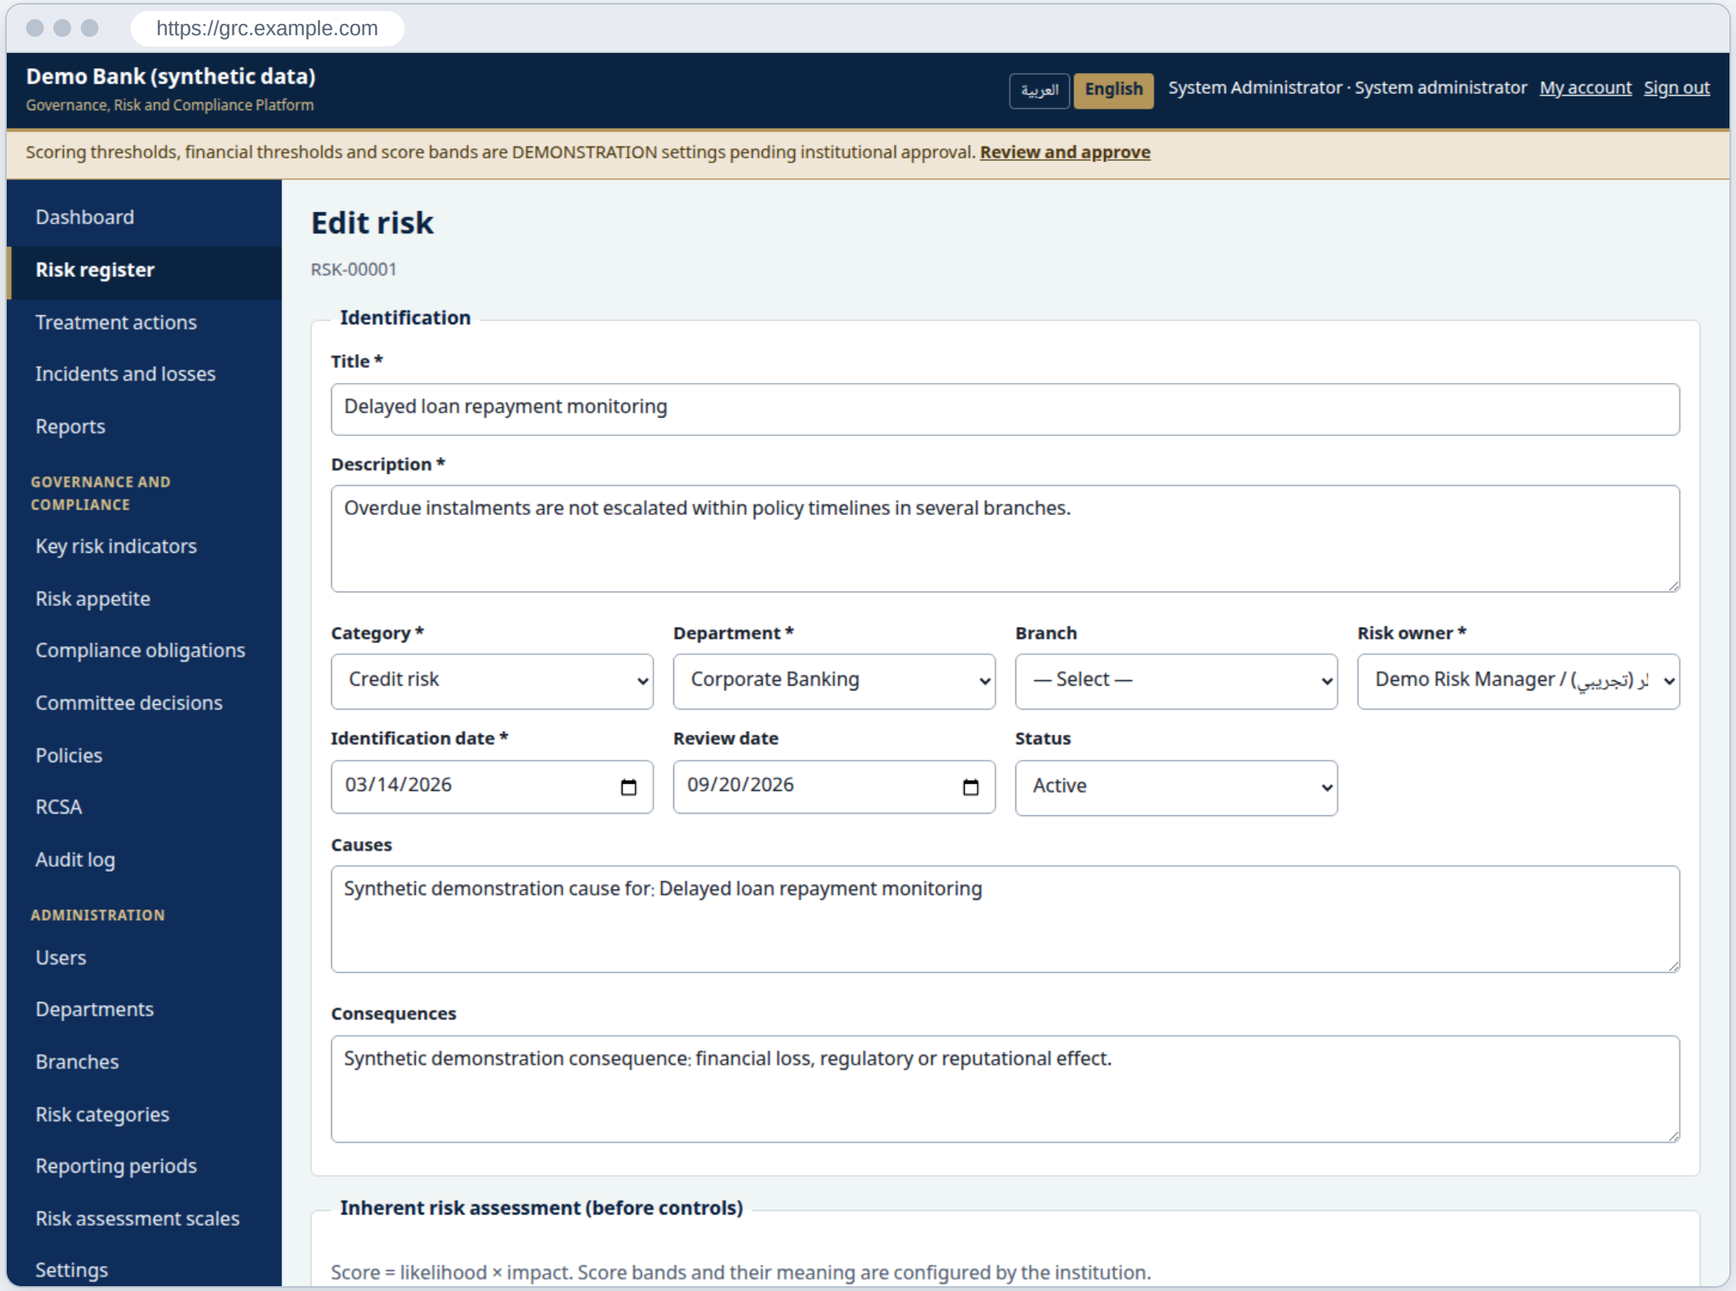

Sections: identification, inherent assessment, controls, residual assessment, treatment. Scores are calculated on the server = likelihood × impact.

How to use it

- Residual is entered explicitly; control effectiveness is never deducted automatically.
- A rationale is required when residual differs from inherent.
- Accepting a high residual risk requires a written justification. The estimated financial impact is advisory only.

Permissions and notes

Matrix labels, thresholds and colours are configurable under Risk assessment scales.

What you see

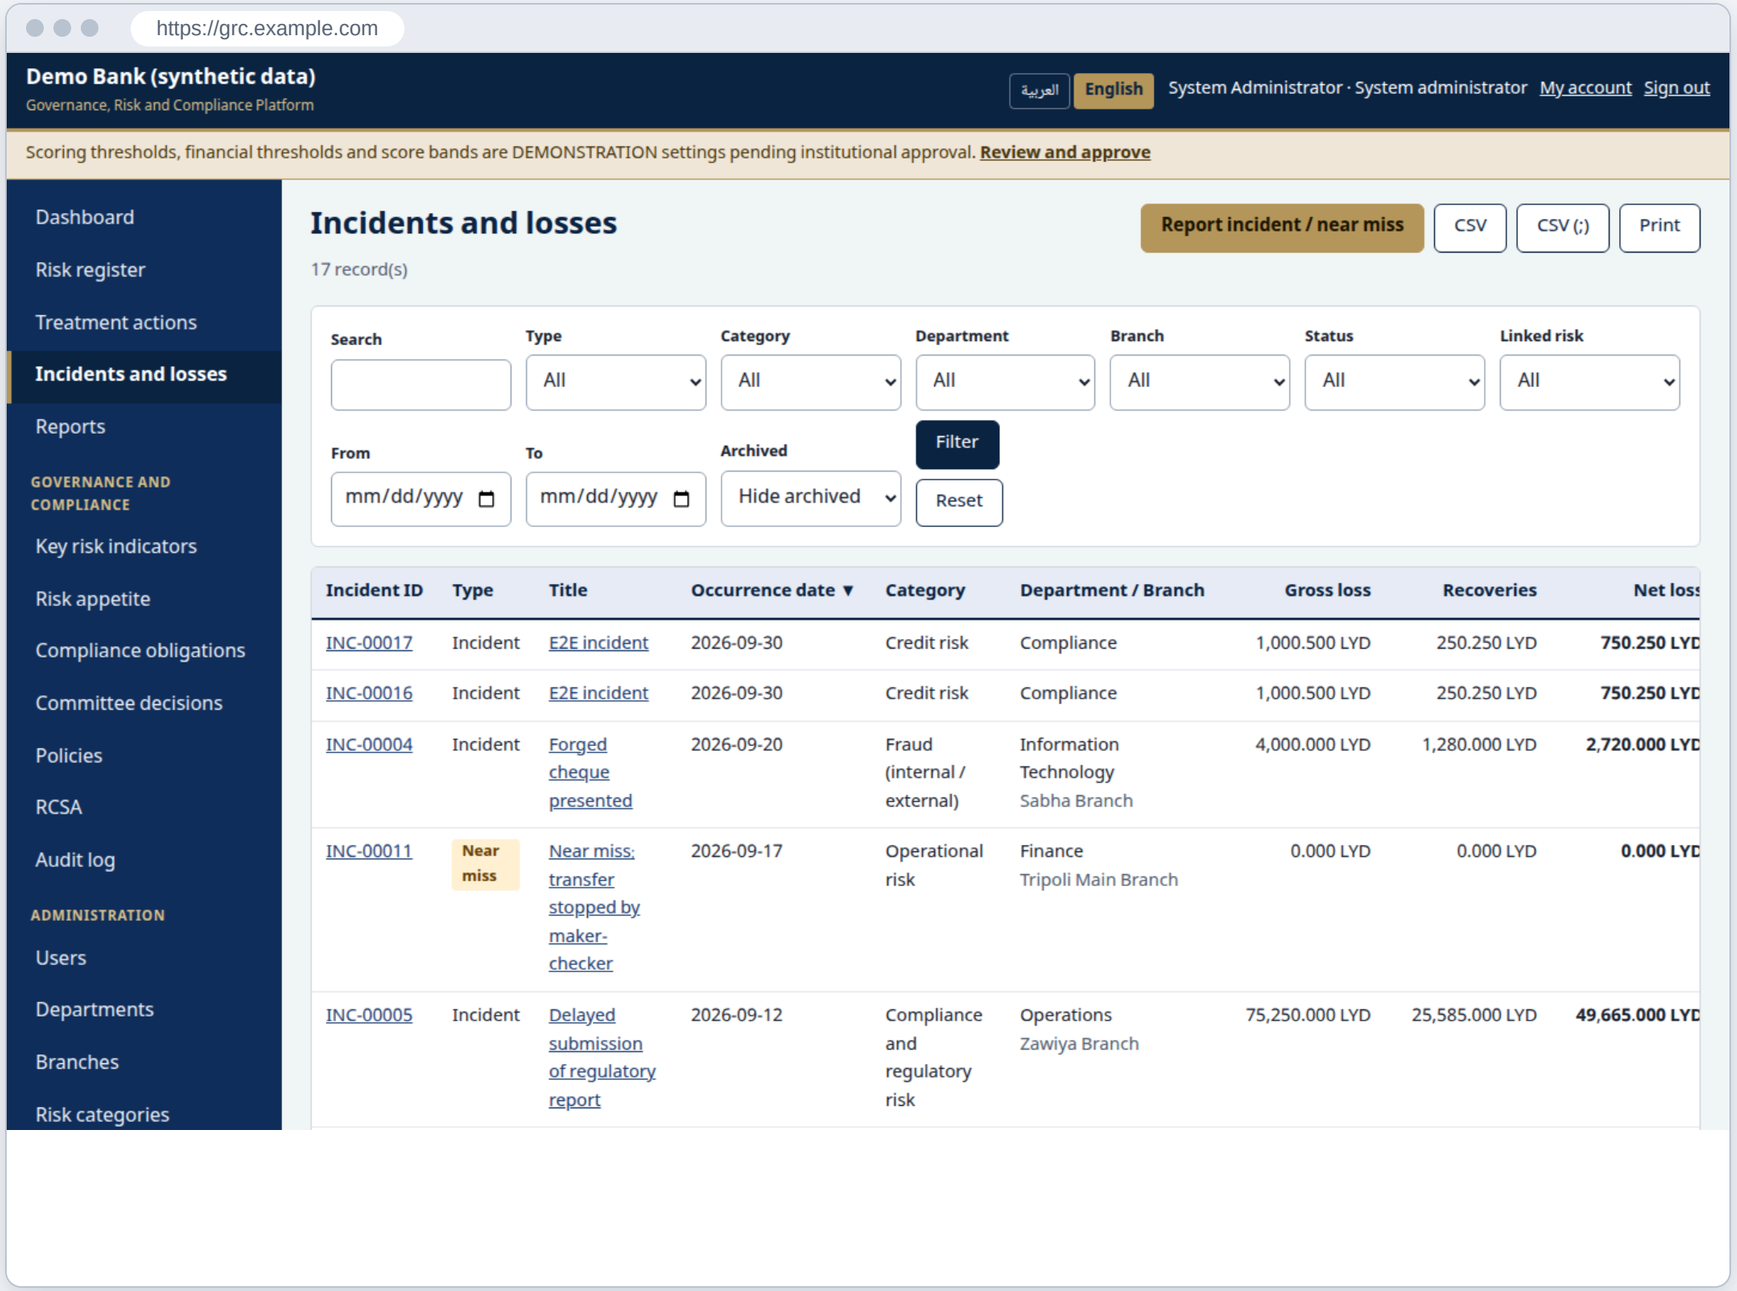

Incident and near-miss register with gross loss, recoveries and net loss, plus totals for the filtered result at the bottom.

How to use it

- Net loss = gross loss − recoveries (exact integer arithmetic).
- Filter by type, category, department, branch, dates and linked risk.
- Export and print follow the same permissions as the screen.

Permissions and notes

A branch liaison records and edits for their branch only.

What you see

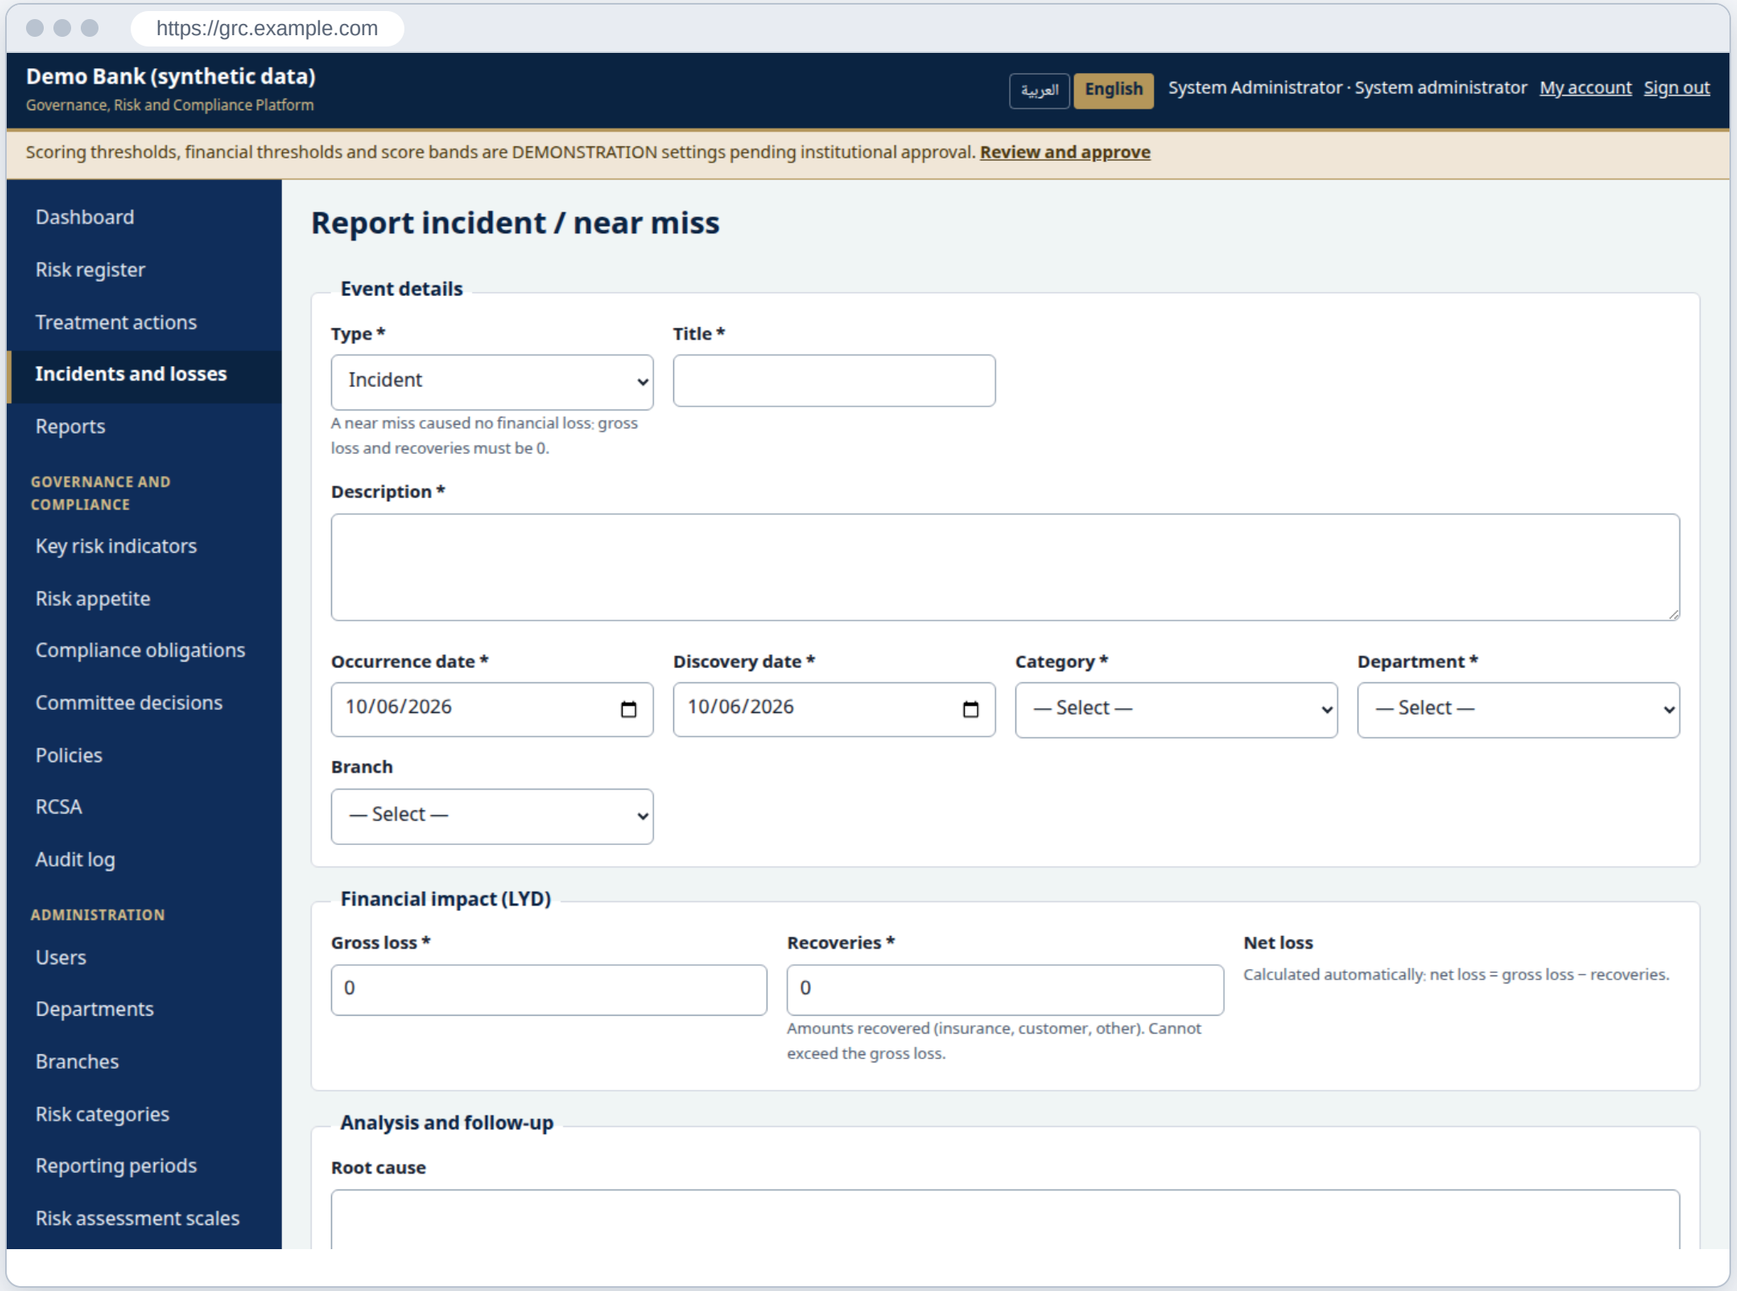

Occurrence and discovery dates, branch, department and category, amounts in LYD (3 decimals), root cause, corrective actions and links to risks.

How to use it

- A near miss must have zero loss.
- Recoveries cannot exceed the gross loss.
- Closing an incident requires a root cause.

Permissions and notes

Drop-downs list only what the user may use.

Treatment actions

Risks

What you see

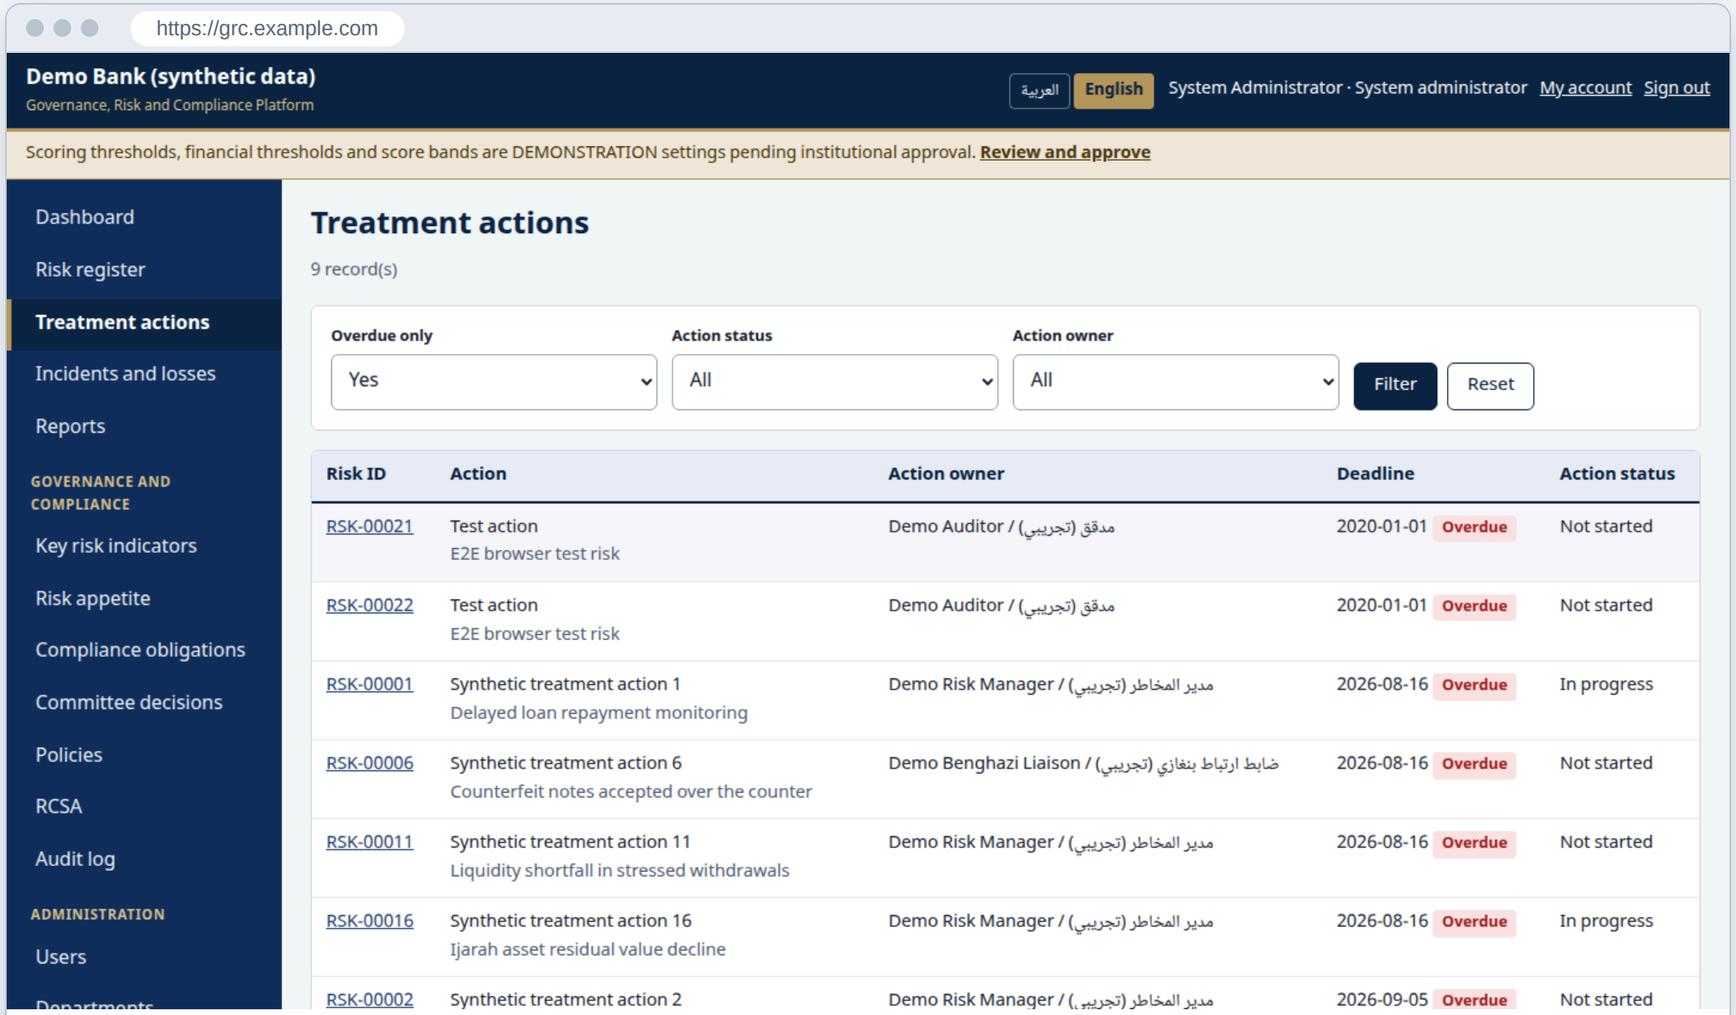

Consolidated list of risk treatment actions with an “overdue only” filter. Opened from the dashboard indicator.

How to use it

- Click the risk ID to jump to its actions section and update the status.
- An overdue action is open with a deadline before today.

Permissions and notes

Respects the department/branch scope.

What you see

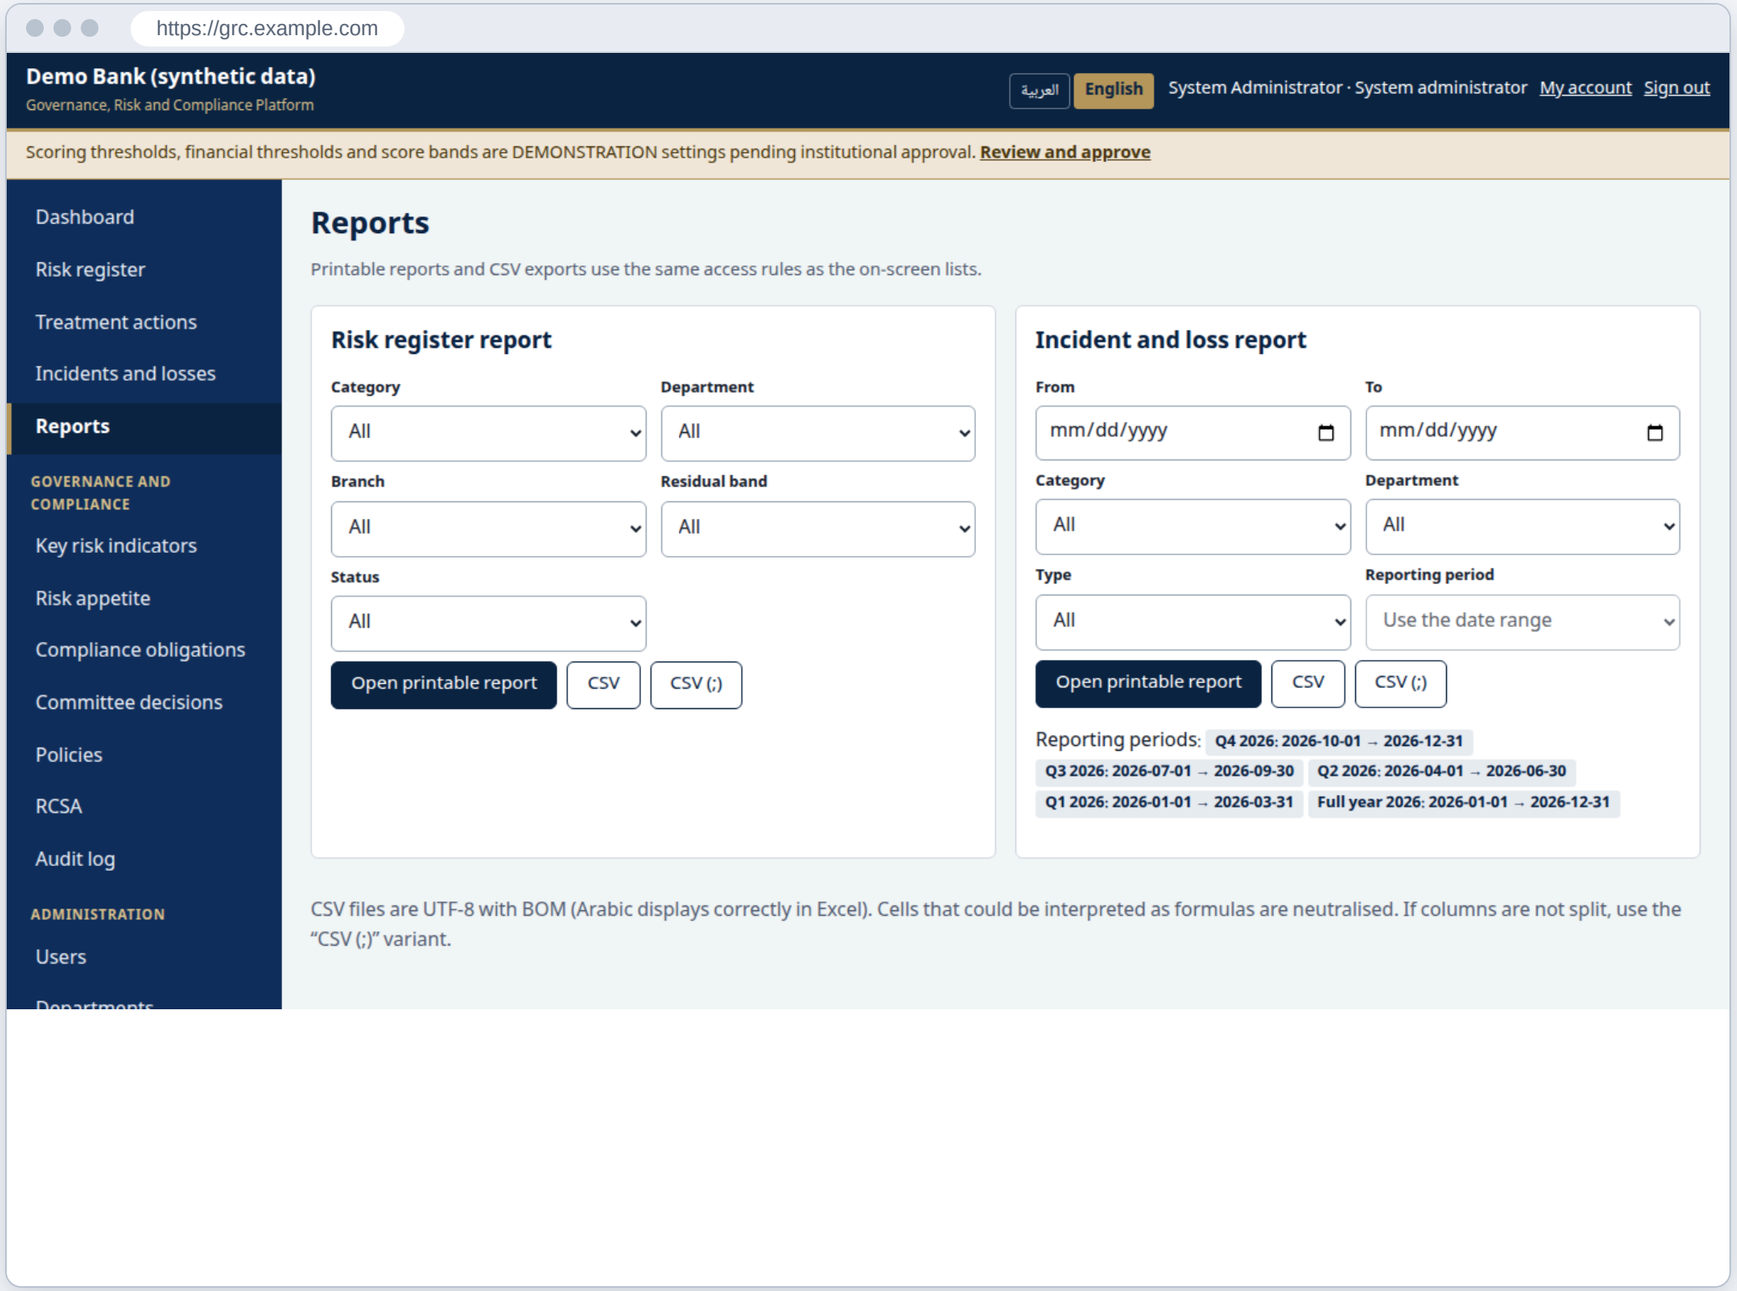

Printable reports (RTL-aware) and CSV files in UTF-8 with BOM so Arabic displays correctly in Excel.

How to use it

- If columns do not split in Excel, use “CSV (;)”.
- Cells starting with = + - @ are neutralised against formula injection.
- To save a PDF: open the printable report and print to PDF.

Permissions and notes

Every export is logged in the audit log with its row count.

What you see

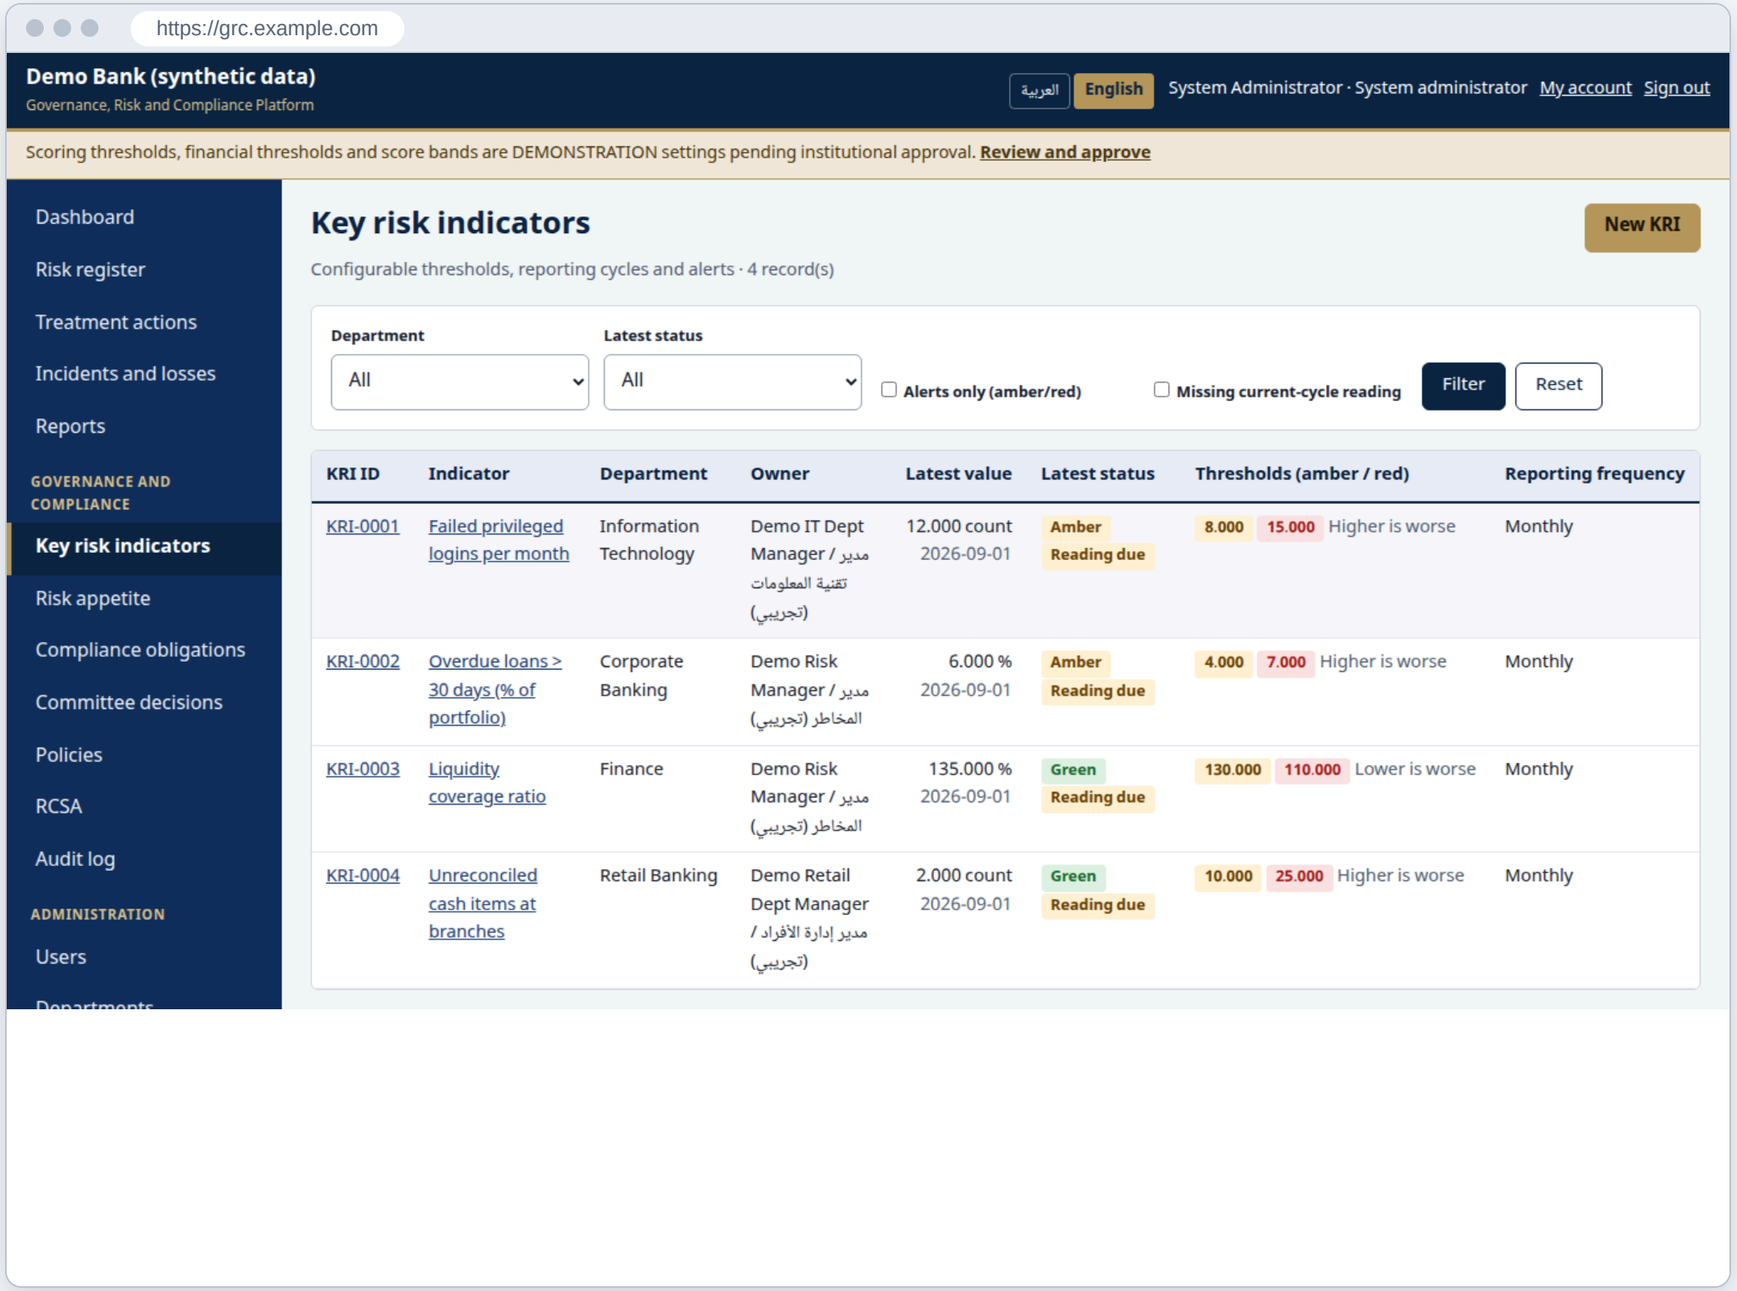

Indicators with amber/red thresholds (higher-is-worse or lower-is-worse), latest reading and status, and a “reading due” badge for monthly/quarterly cycles.

How to use it

- Open a KRI to add a reading; the status is calculated automatically.
- Editing thresholds re-evaluates earlier readings.
- Filters: alerts only, missing current-cycle reading.

Permissions and notes

Define: administrator/risk manager. Enter readings: risk, compliance and department managers (own department).

What you see

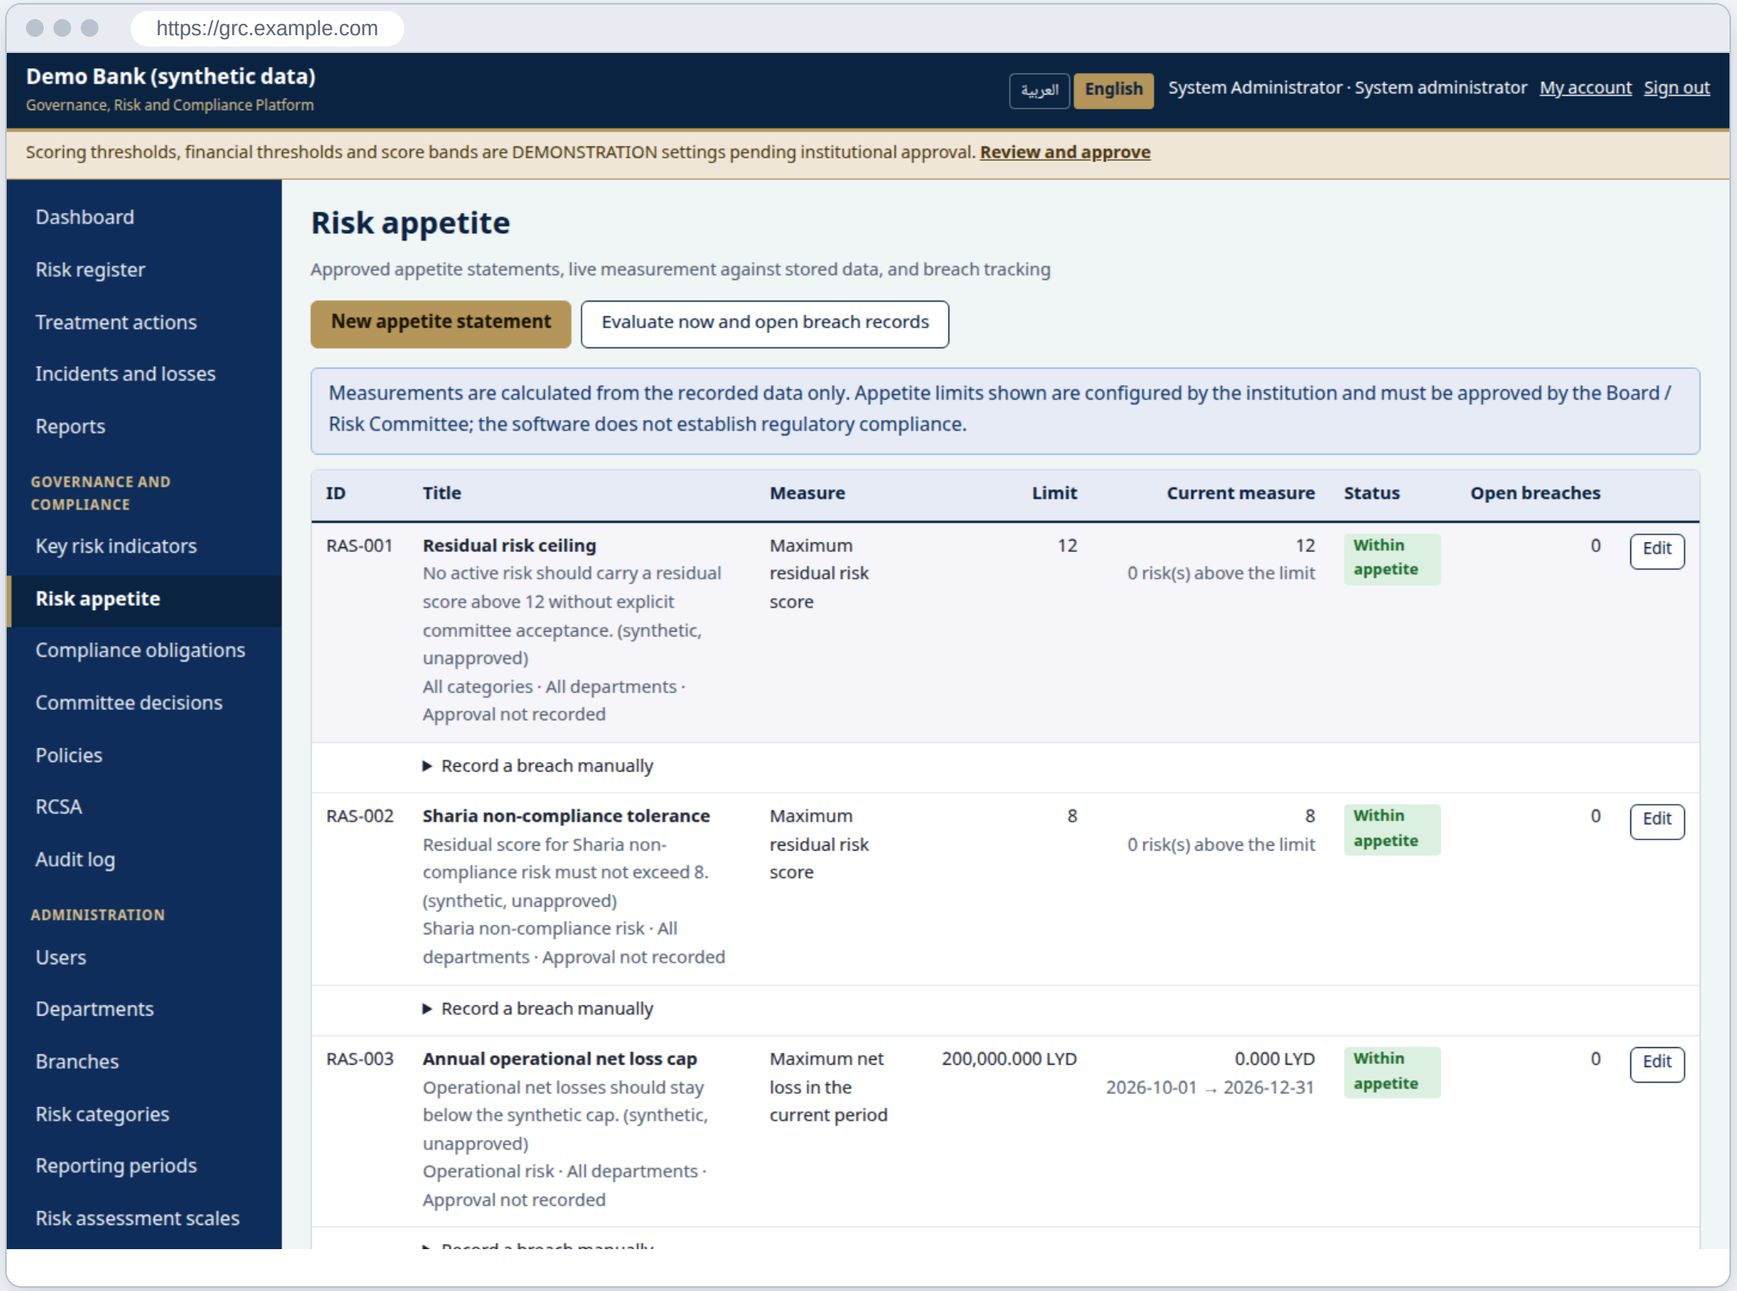

Appetite statements (maximum residual score or maximum net loss) with live measurement from the data and a breach register.

How to use it

- Evaluate now opens one breach record per breached statement, without duplicates.
- Breach flow: open → escalated → accepted/resolved with a mandatory note.
- Limits shown are demonstration values and need Board / Risk Committee approval.

Permissions and notes

View: administrator, risk, compliance, executive, auditor. Edit: administrator and risk manager.

What you see

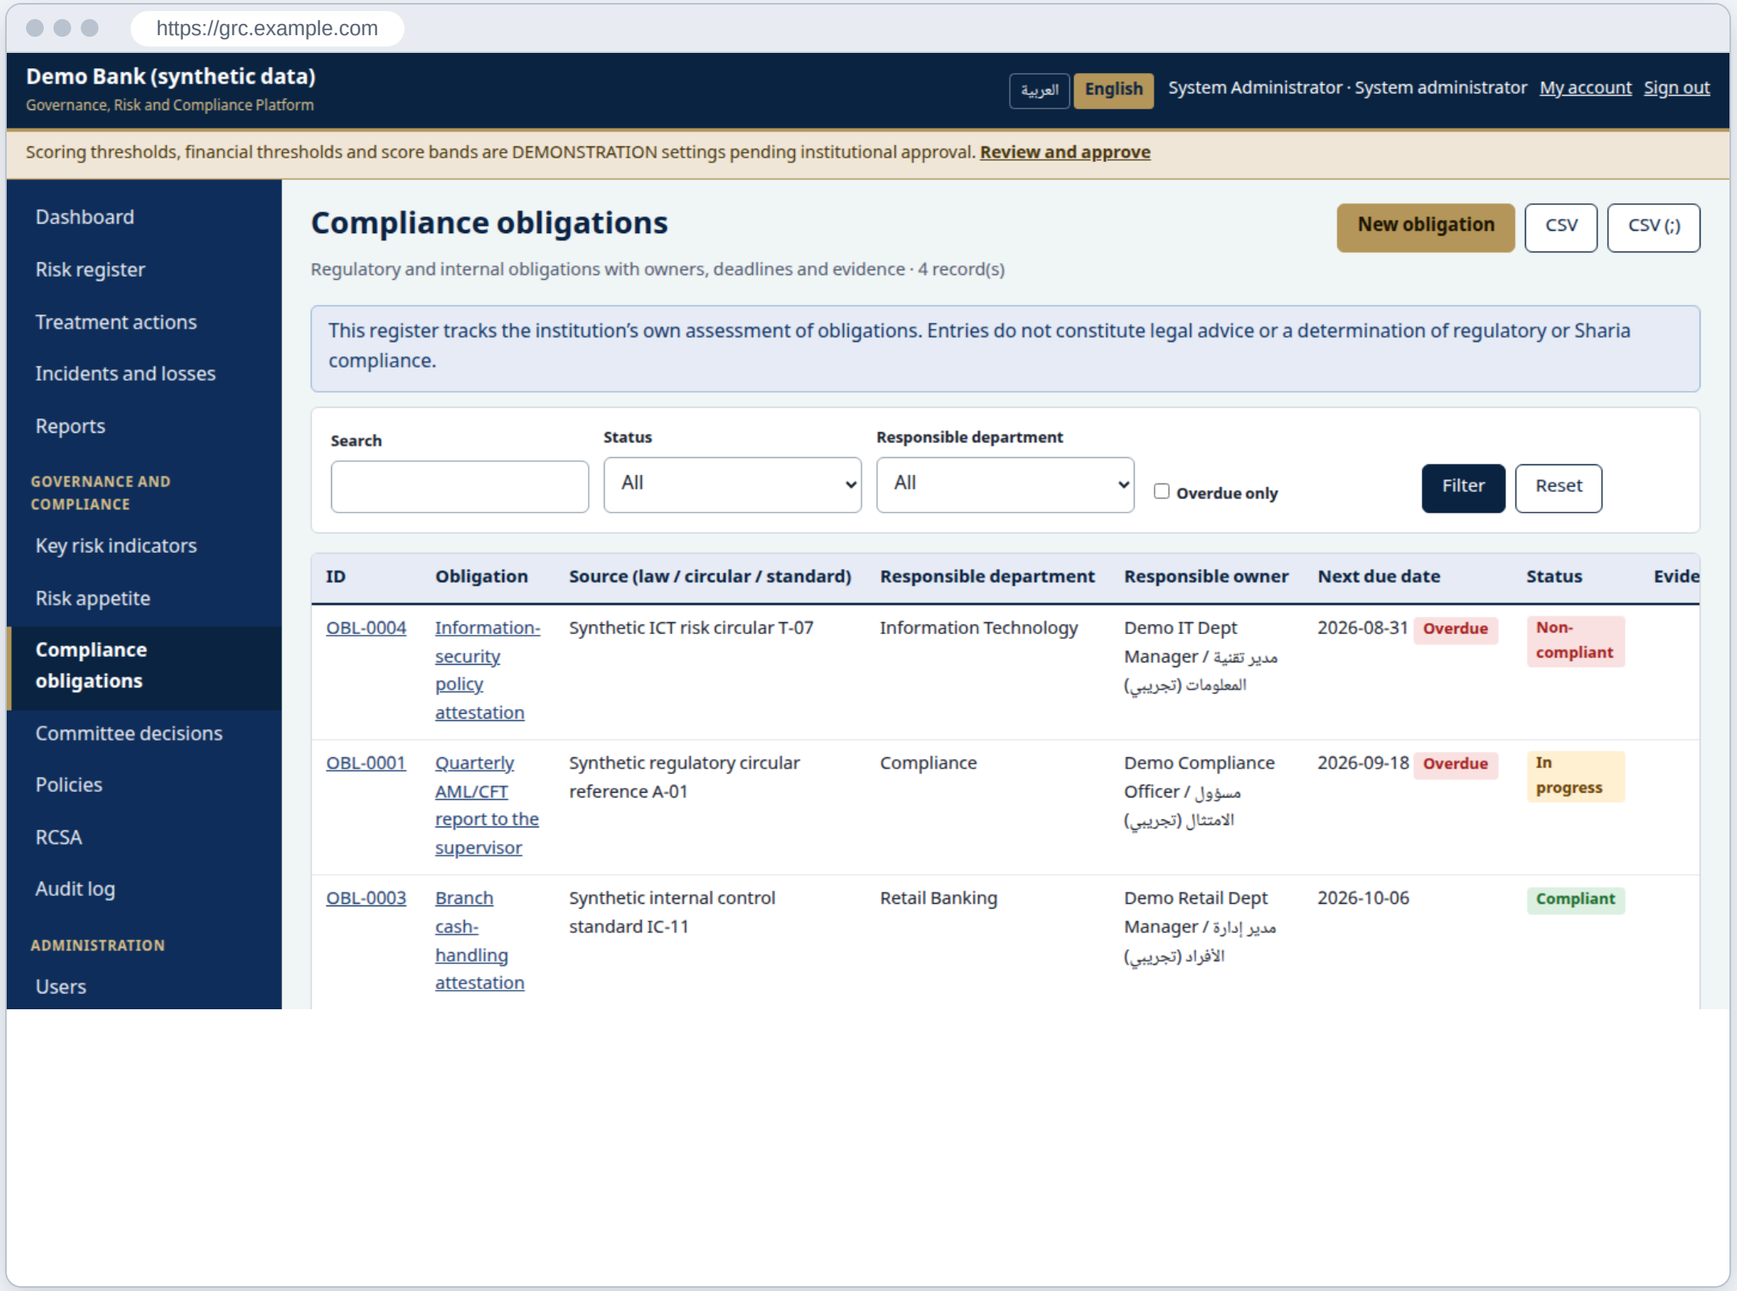

Register of regulatory and internal obligations: source, owner, frequency, due date, status and number of evidence files.

How to use it

- “Compliant” needs attached evidence or a note.
- “Non-compliant / not applicable” need a note.
- Recurring obligations have a “roll to next cycle” button. CSV export is available.

Permissions and notes

Define: administrator and compliance. Update status/evidence: department manager for their department. This register is not a determination of regulatory or Sharia compliance.

Committee decisions

Governance and compliance

What you see

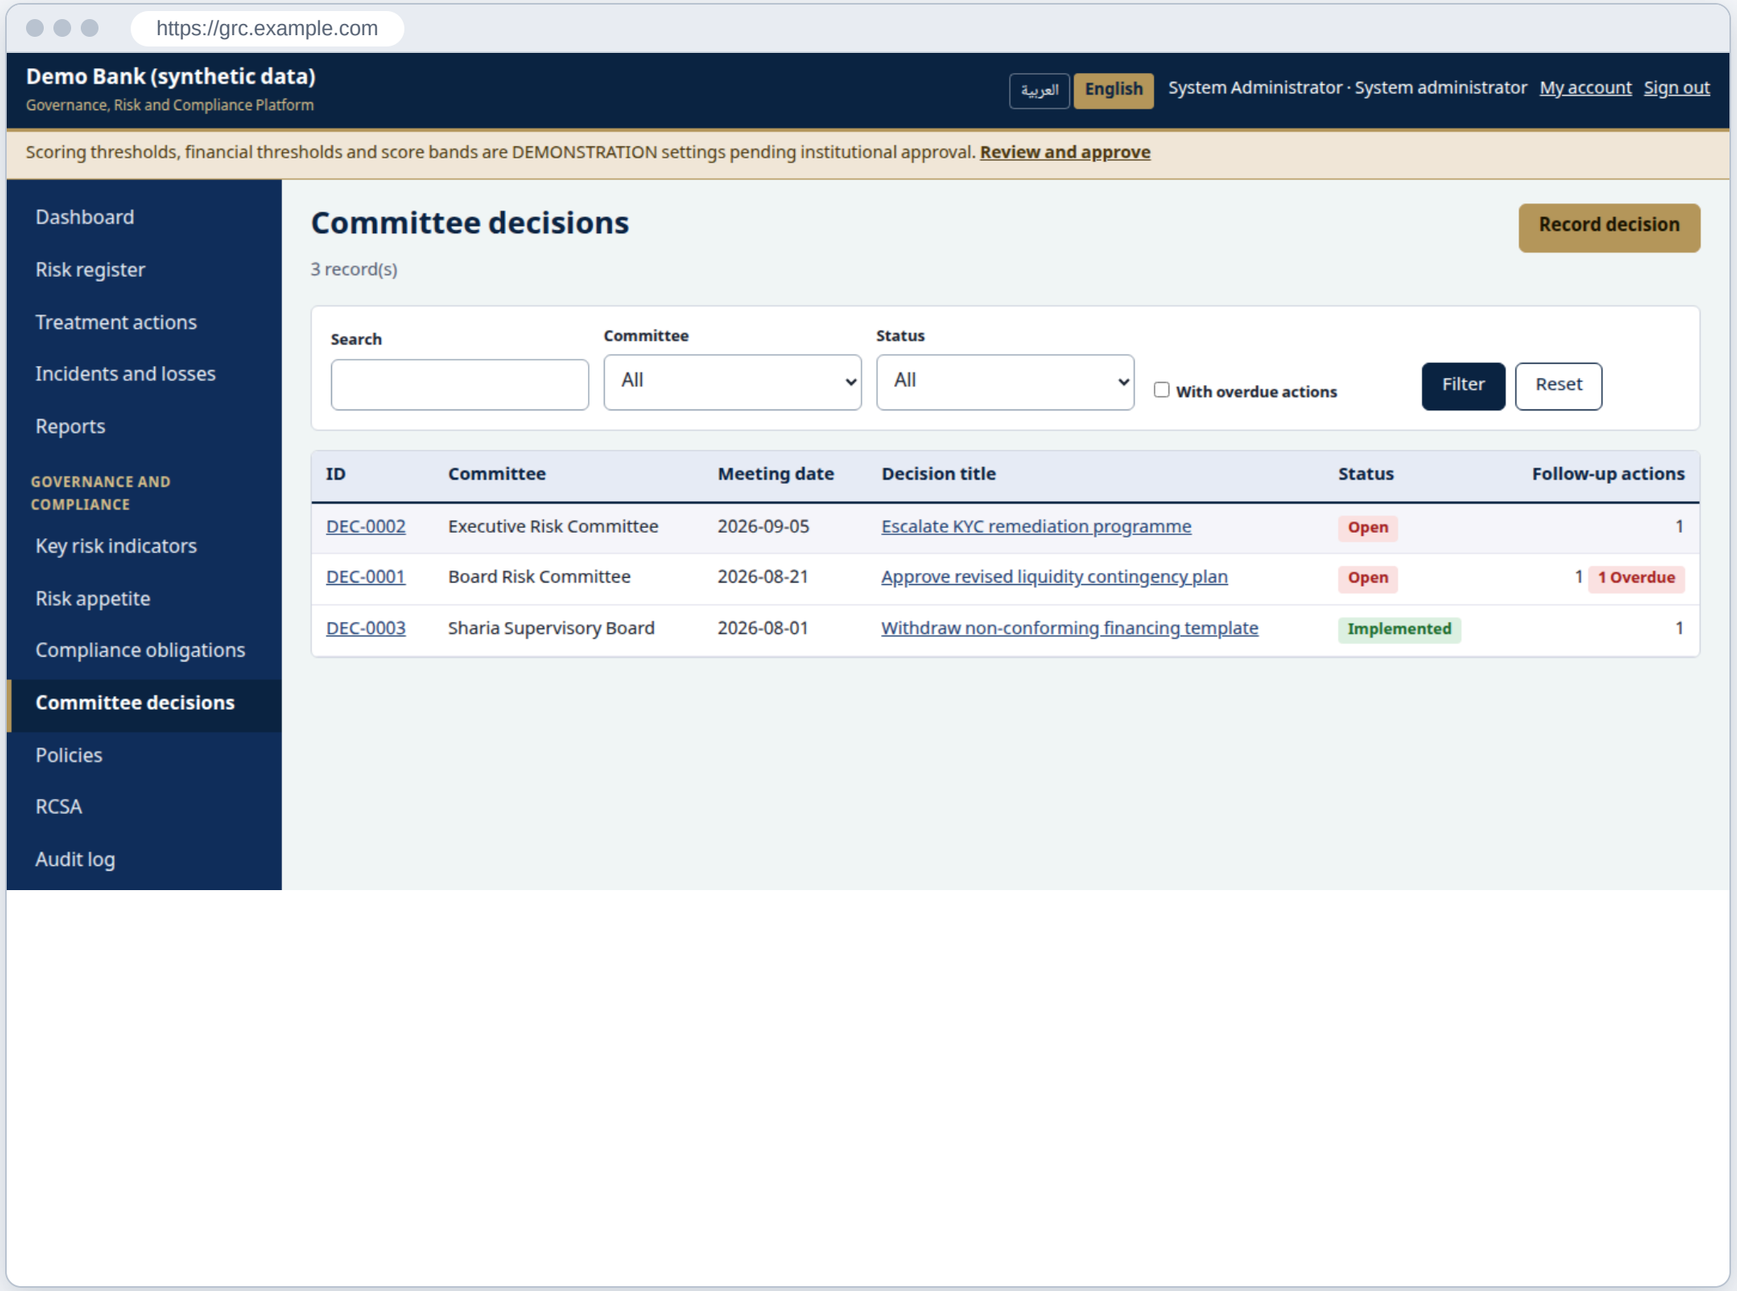

Decisions of the Board risk and audit committees, executive committee, ALCO and the Sharia supervisory board, with follow-up actions and overdue tracking.

How to use it

- Open a decision to add follow-up actions (owner, deadline, status).
- Filter: with overdue actions.

Permissions and notes

View: administrator, risk, compliance, executive, auditor. Manage: administrator, risk, compliance.

What you see

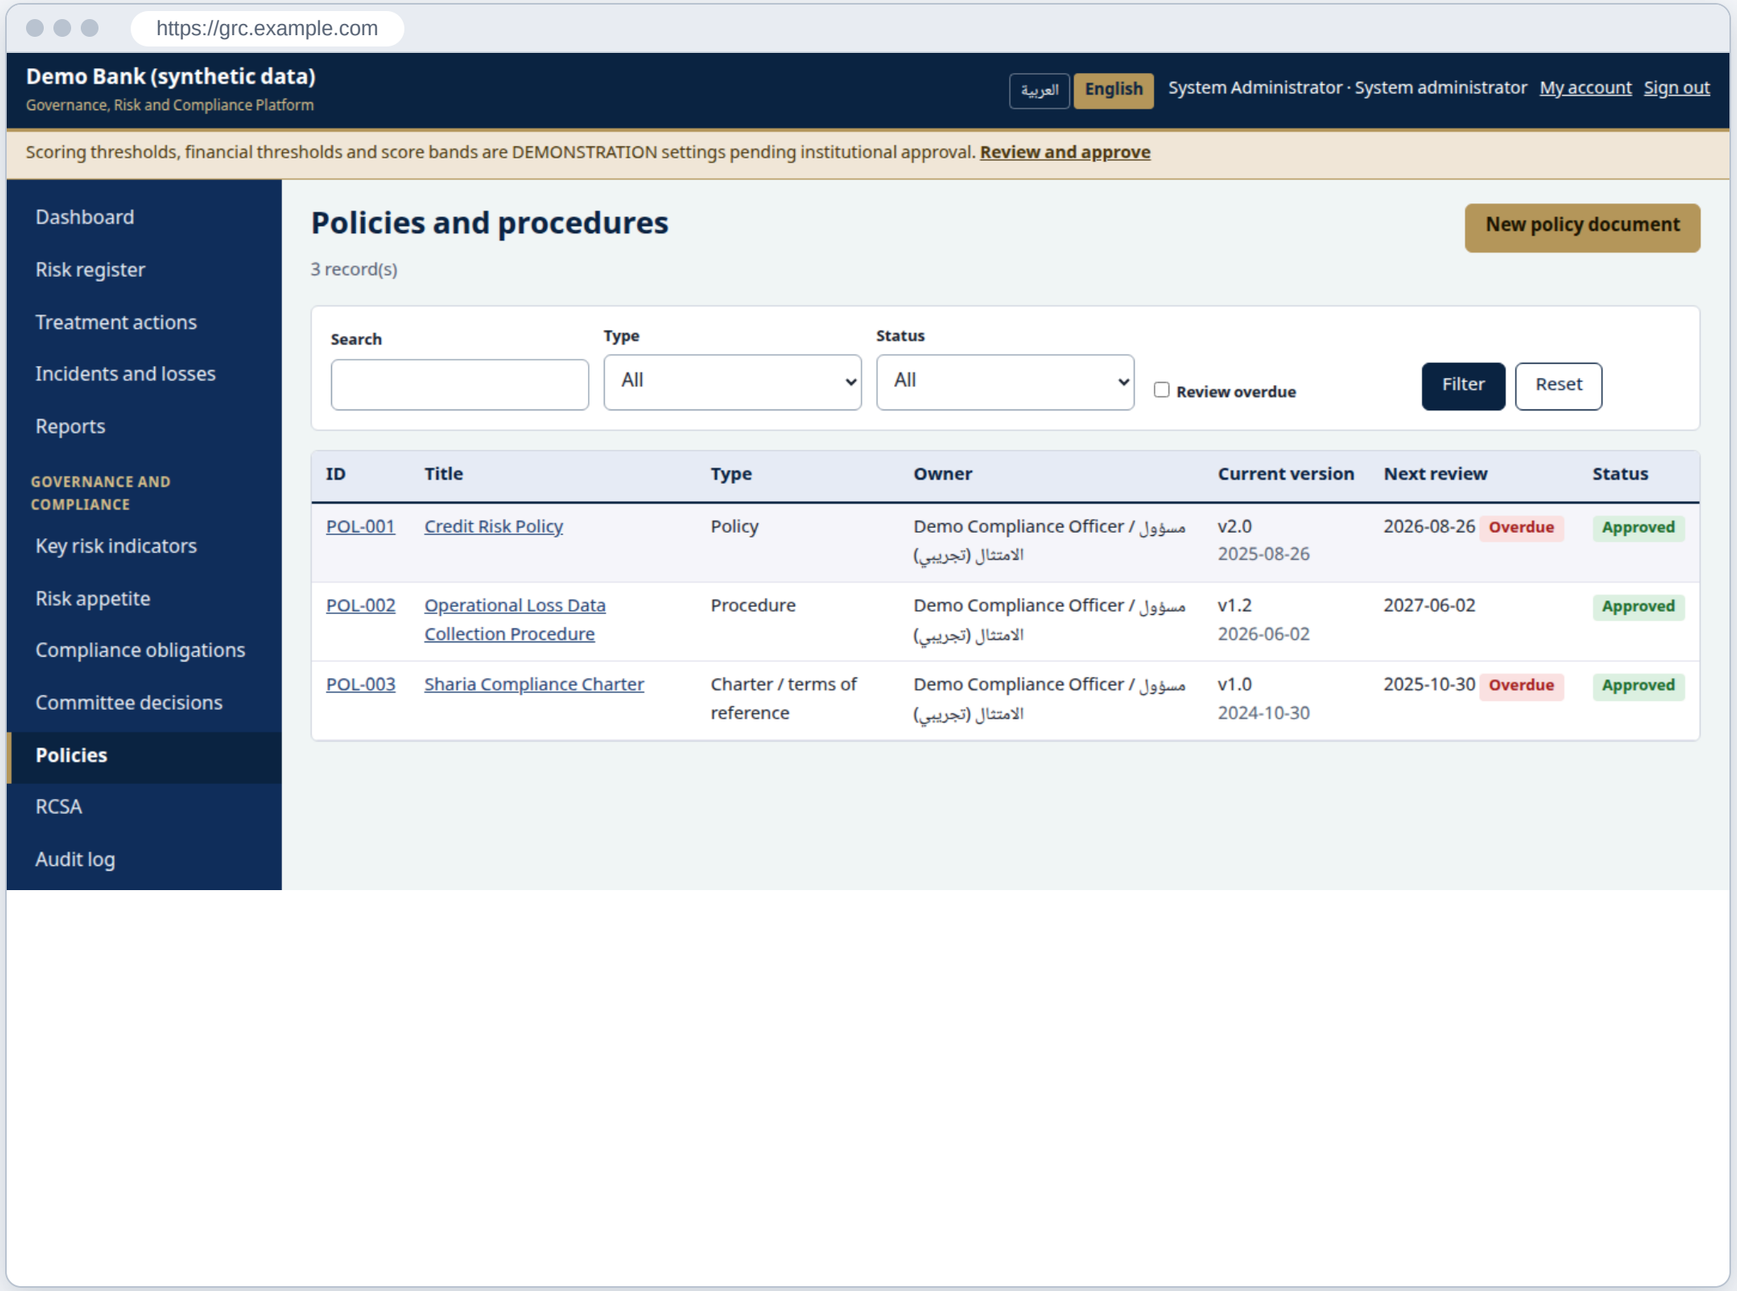

Register of policies, procedures and standards with the current version and next review date.

How to use it

- Each new version is stored in an immutable history and becomes the current one.
- A version document can be attached; the next review is computed from the effective date.

Permissions and notes

Everyone can read. Manage: administrator, risk, compliance.

What you see

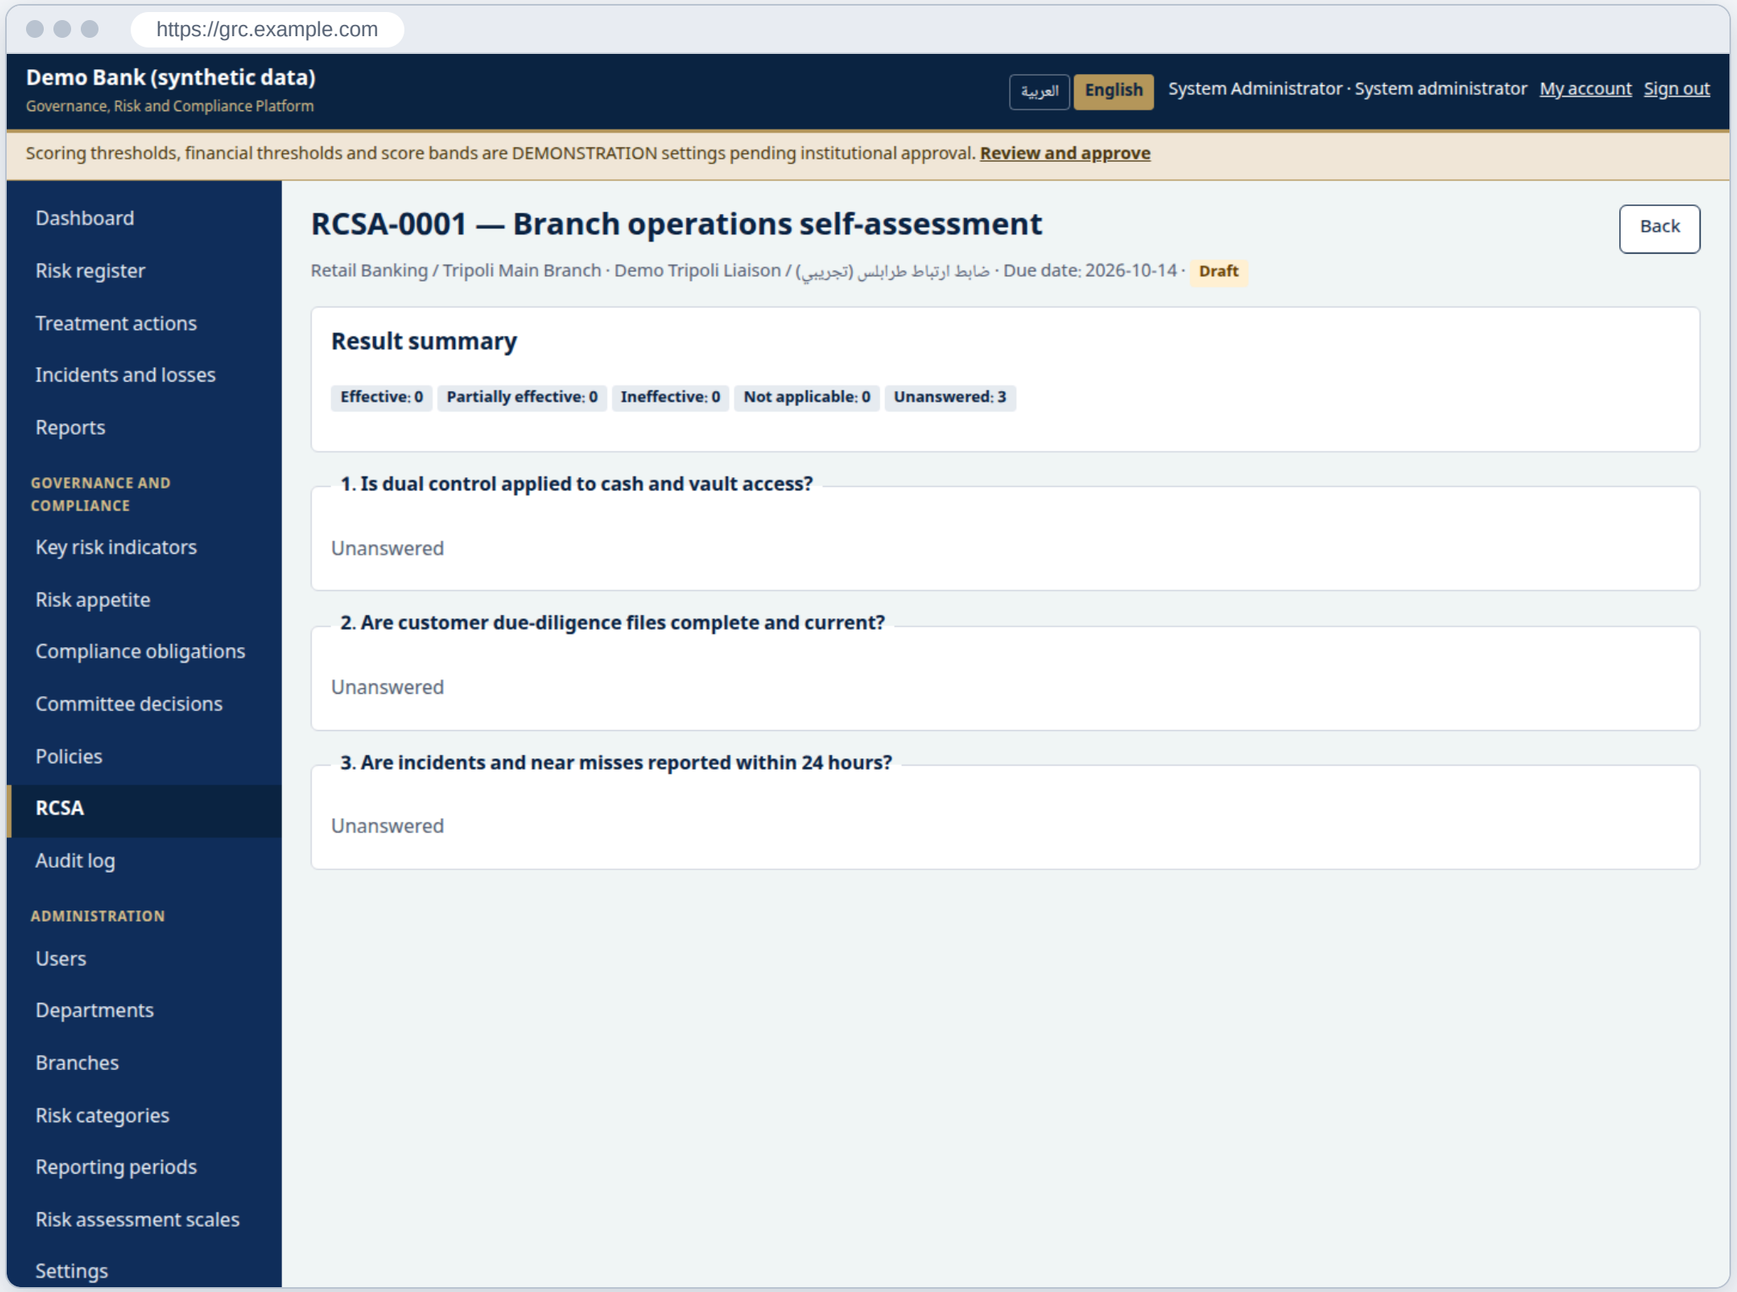

Bilingual questionnaire launched for a department/branch: rate each question, comment and link a risk.

How to use it

- The assessor saves a draft then submits for review.
- The reviewer approves or returns with a comment; assessors cannot review their own assessment.

Permissions and notes

Respond: department manager / branch liaison within scope. Launch and review: administrator and risk manager.

What you see

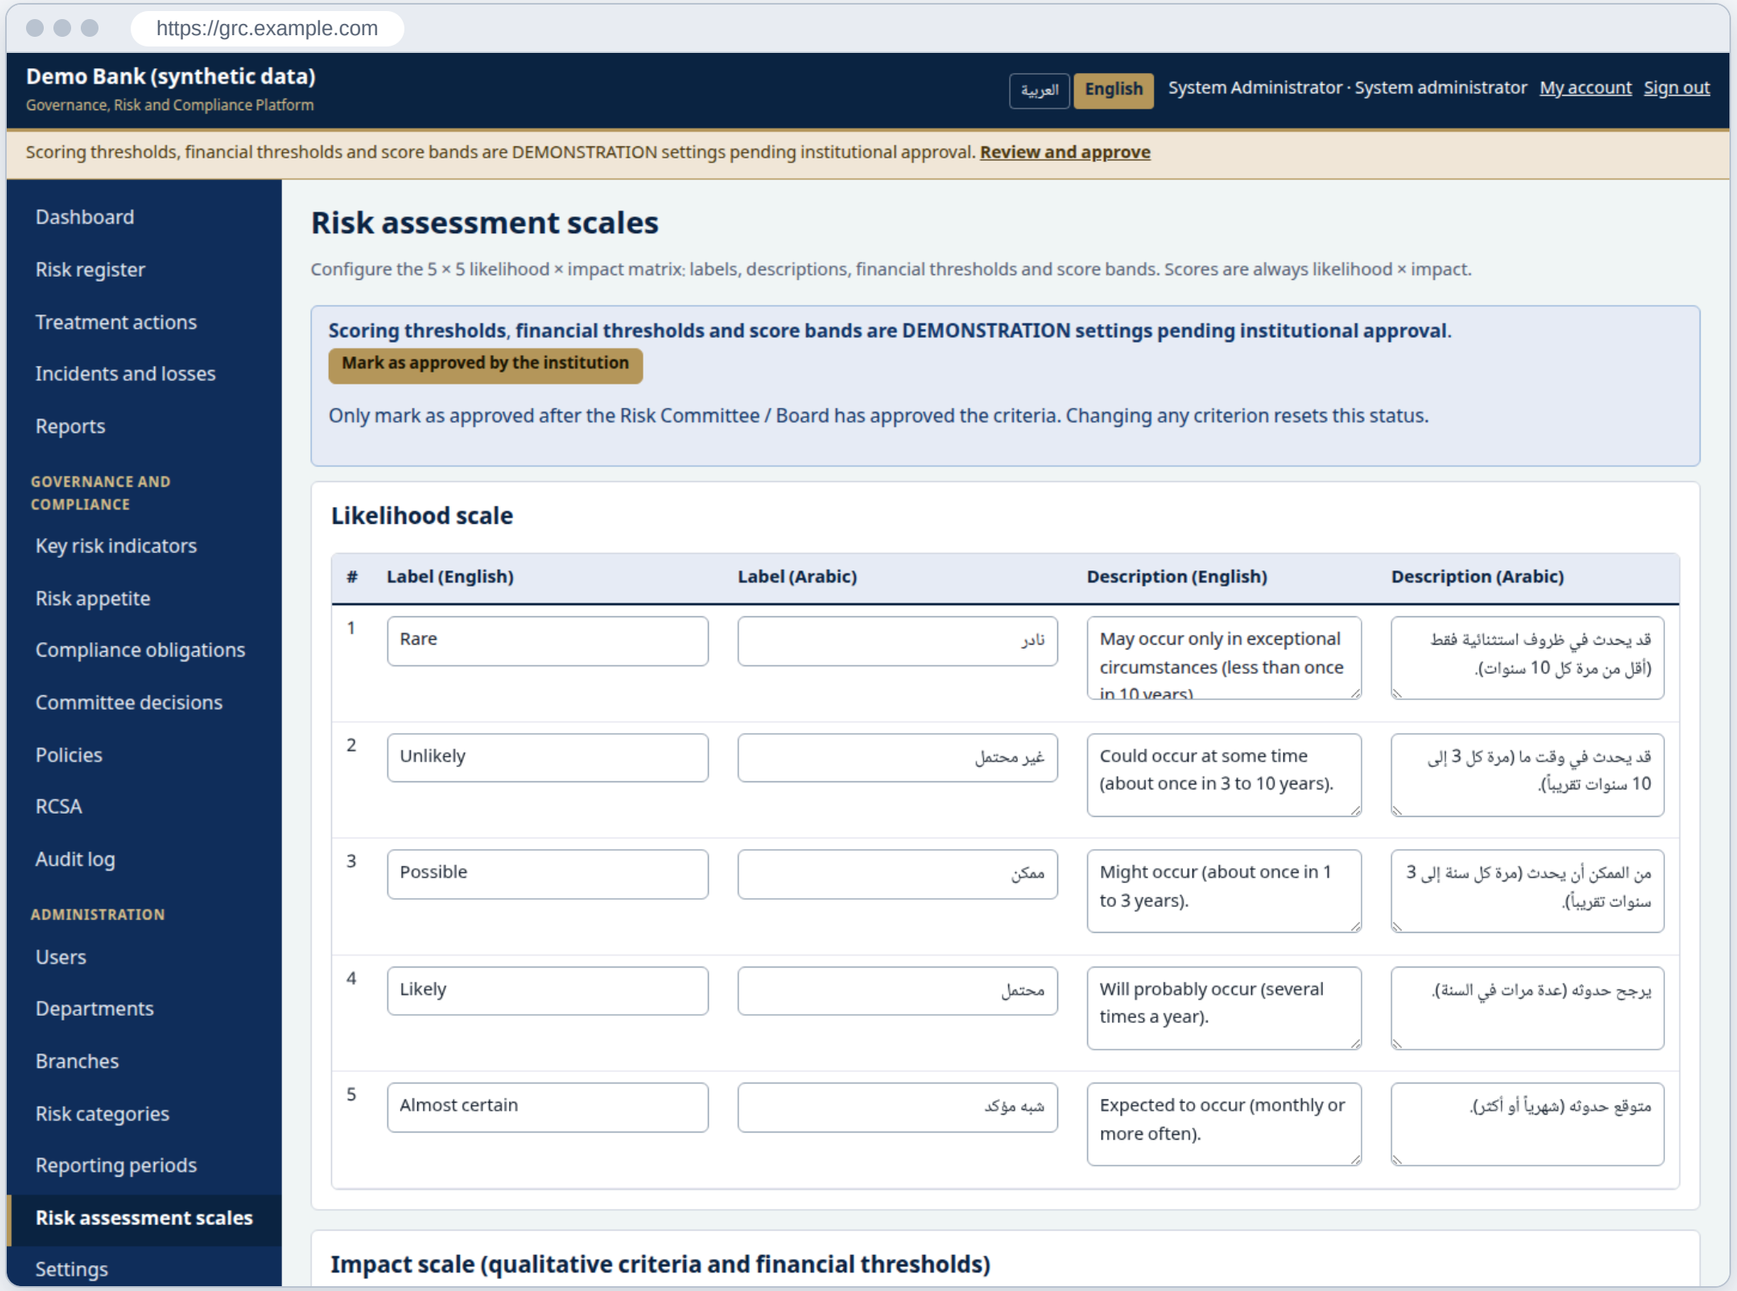

Configure the 5×5 matrix: Arabic/English labels, likelihood and impact descriptions, financial thresholds in LYD, score bands and colours.

How to use it

- Bands must cover scores 1–25 with no gaps or overlaps.
- The current values are DEMONSTRATION settings pending institutional approval: a banner shows until approval is recorded, and any later change resets it.

Permissions and notes

System administrator and risk manager only.

What you see

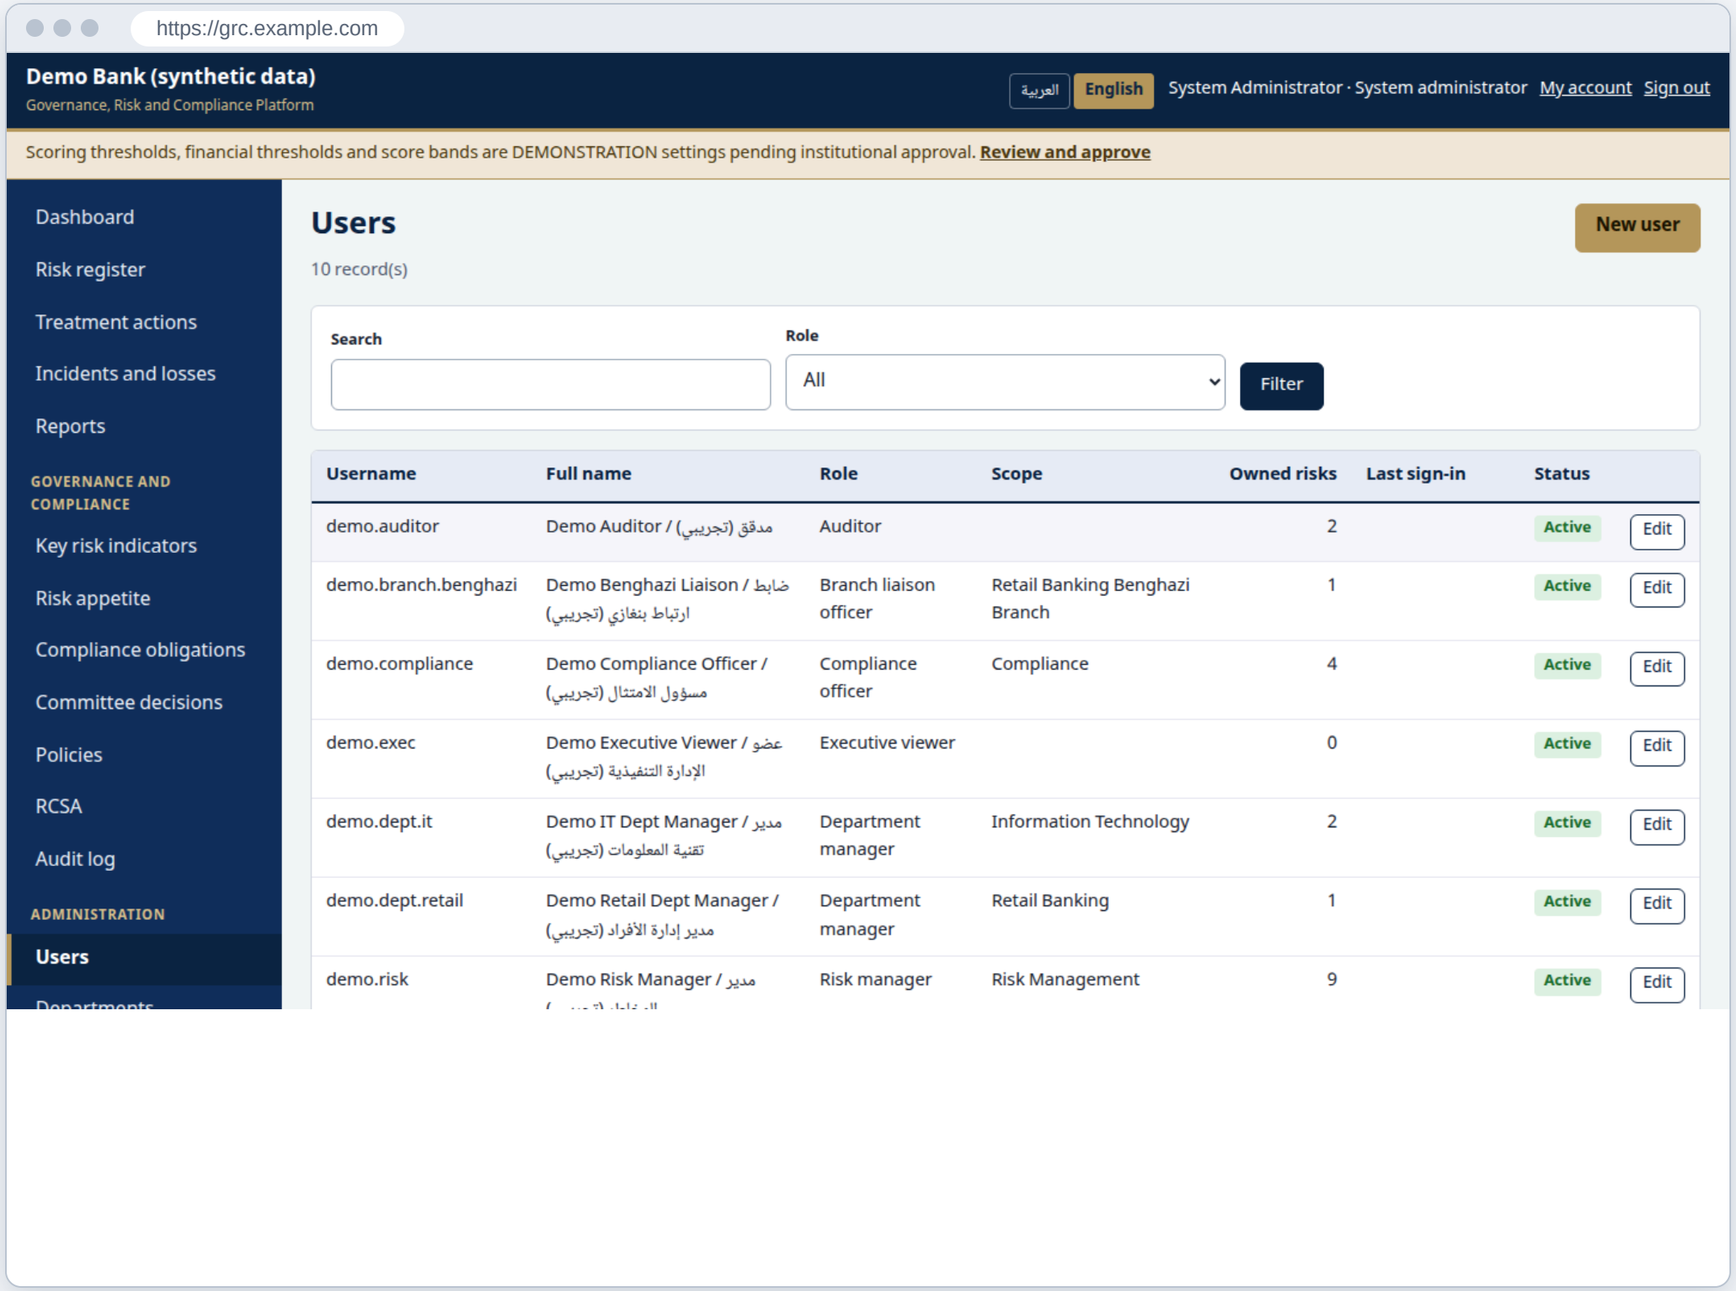

Account management, the seven roles and department/branch scope. From the same menu: departments, branches, risk categories, reporting periods and settings.

How to use it

- Users are deactivated, never deleted; the last administrator cannot be deactivated.
- A password reset forces the user to change it.
- Risk ownership can be transferred from the user page.
- Risk categories include configurable Islamic banking categories.

Permissions and notes

System administrator only.

What you see

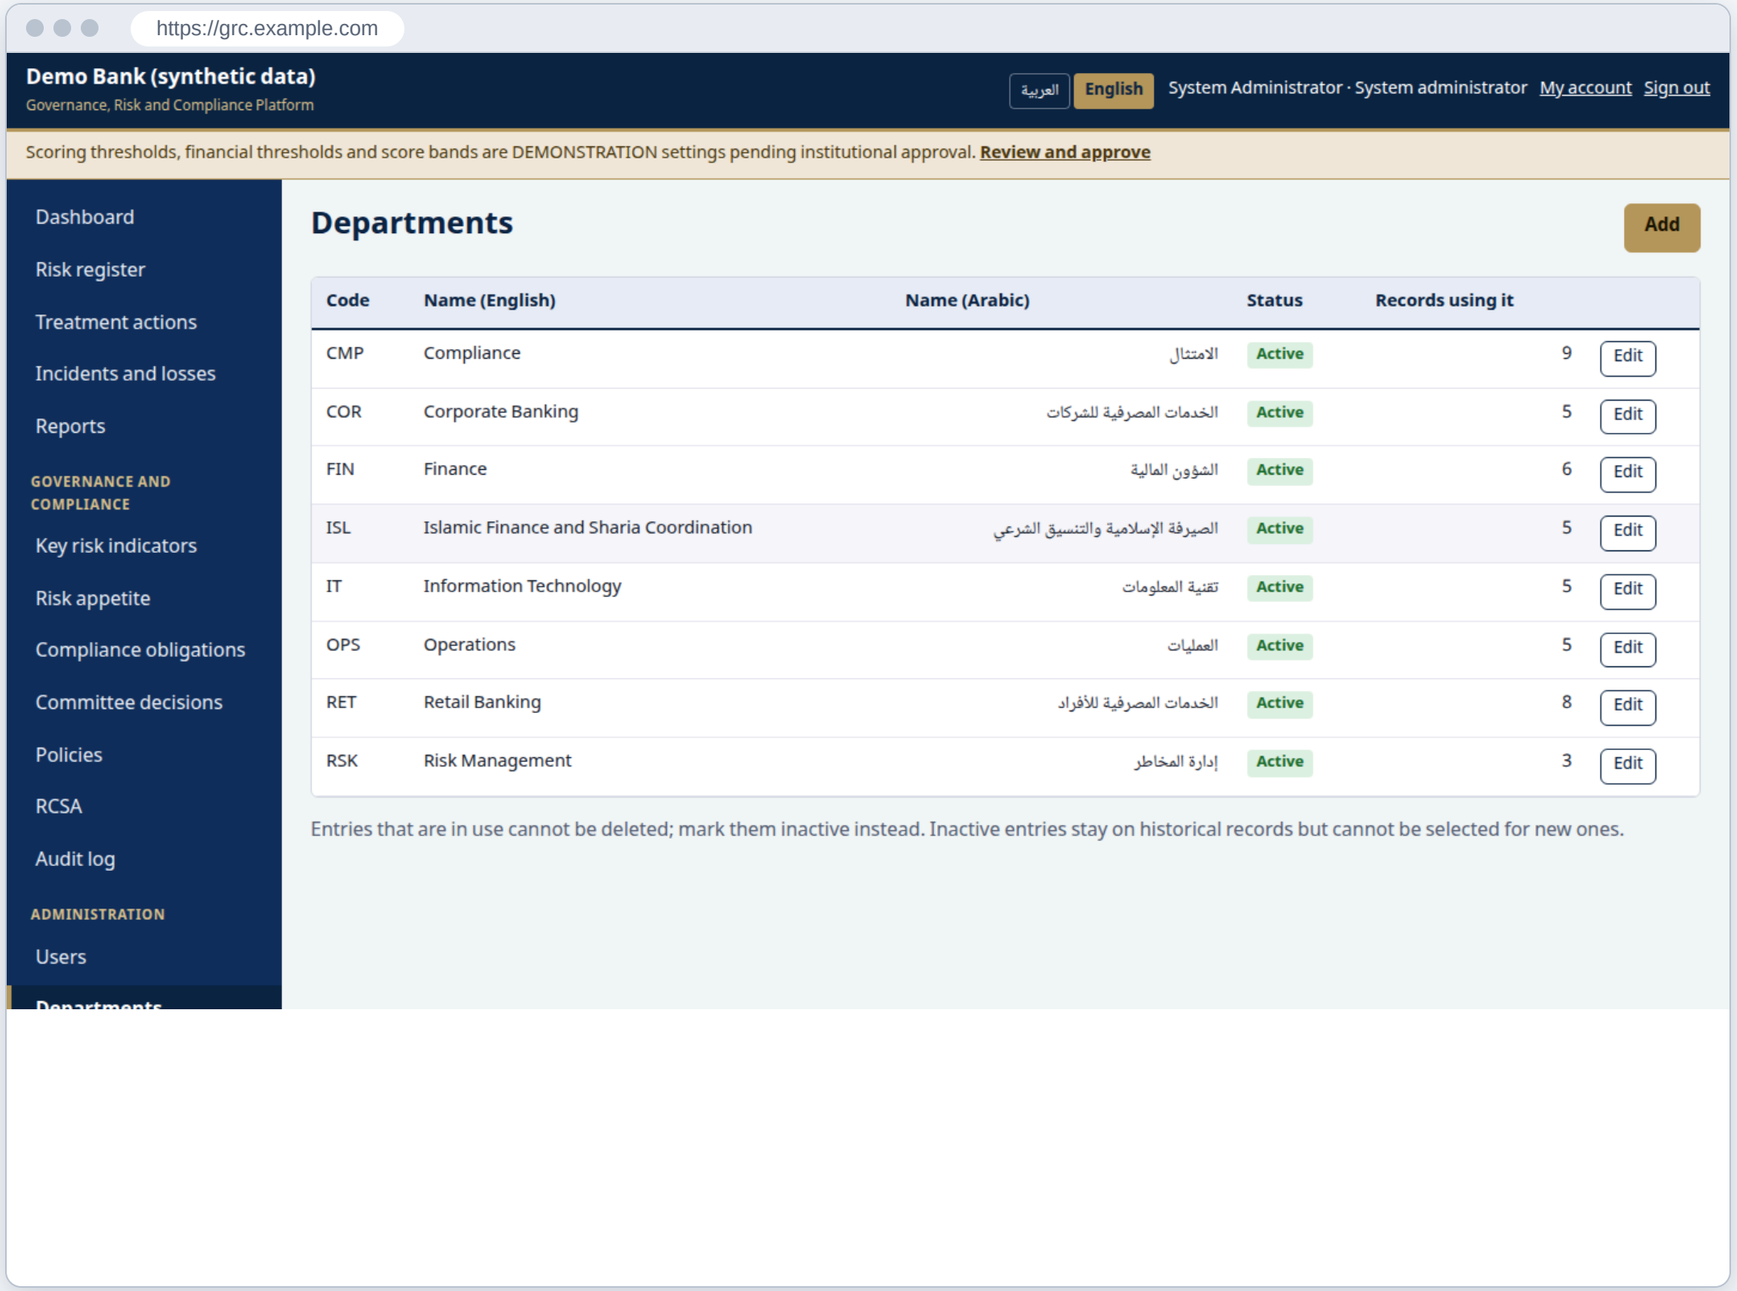

Departments with code, Arabic and English names and the number of records using each.

How to use it

- Add or edit a department.
- Used departments cannot be deleted: deactivate them; they stay on history but cannot be chosen for new records.

Permissions and notes

System administrator only. A department is the access scope of department managers.

What you see

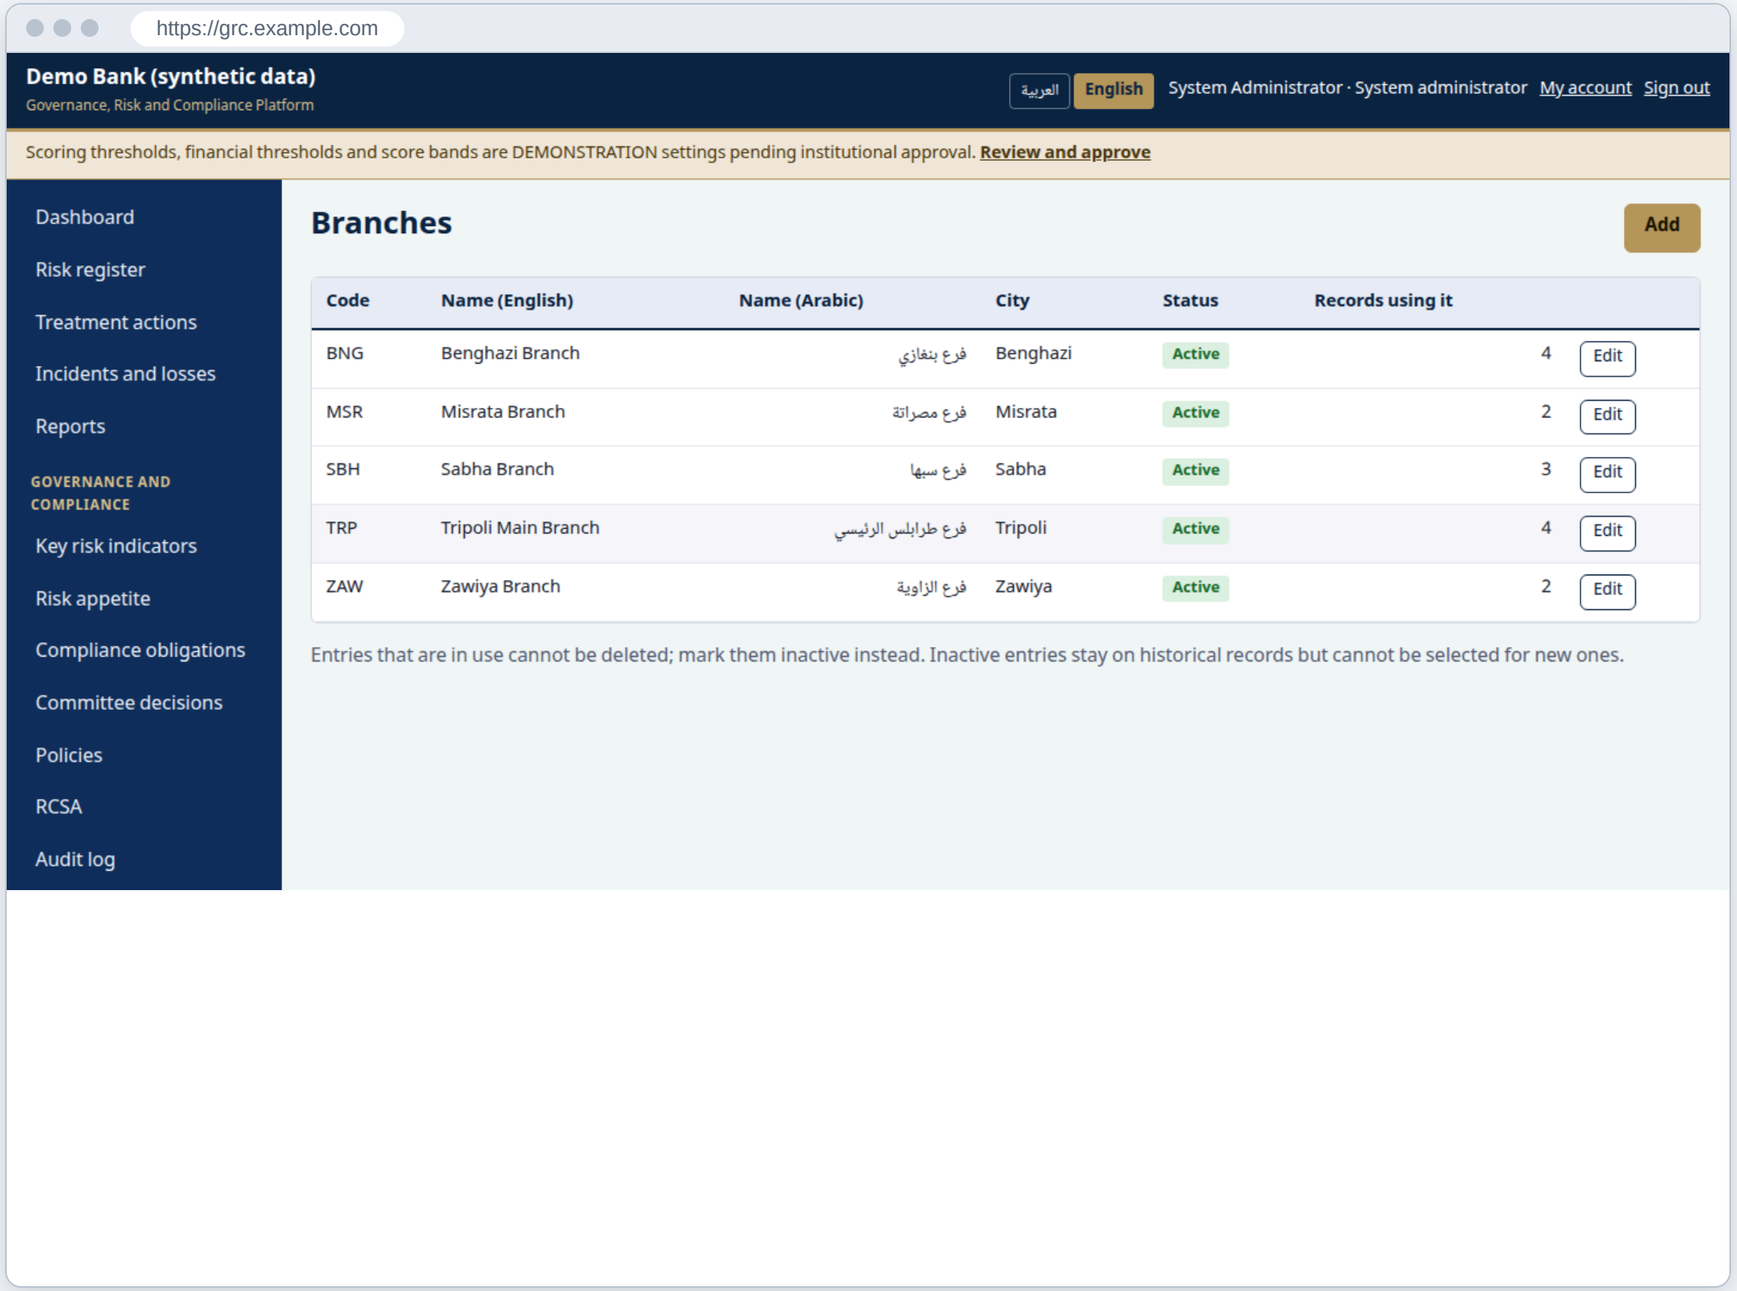

Branches with code, names, city and usage count.

How to use it

- A branch liaison is tied to one branch, which limits their data.
- Deactivate instead of deleting.

Permissions and notes

System administrator only.

What you see

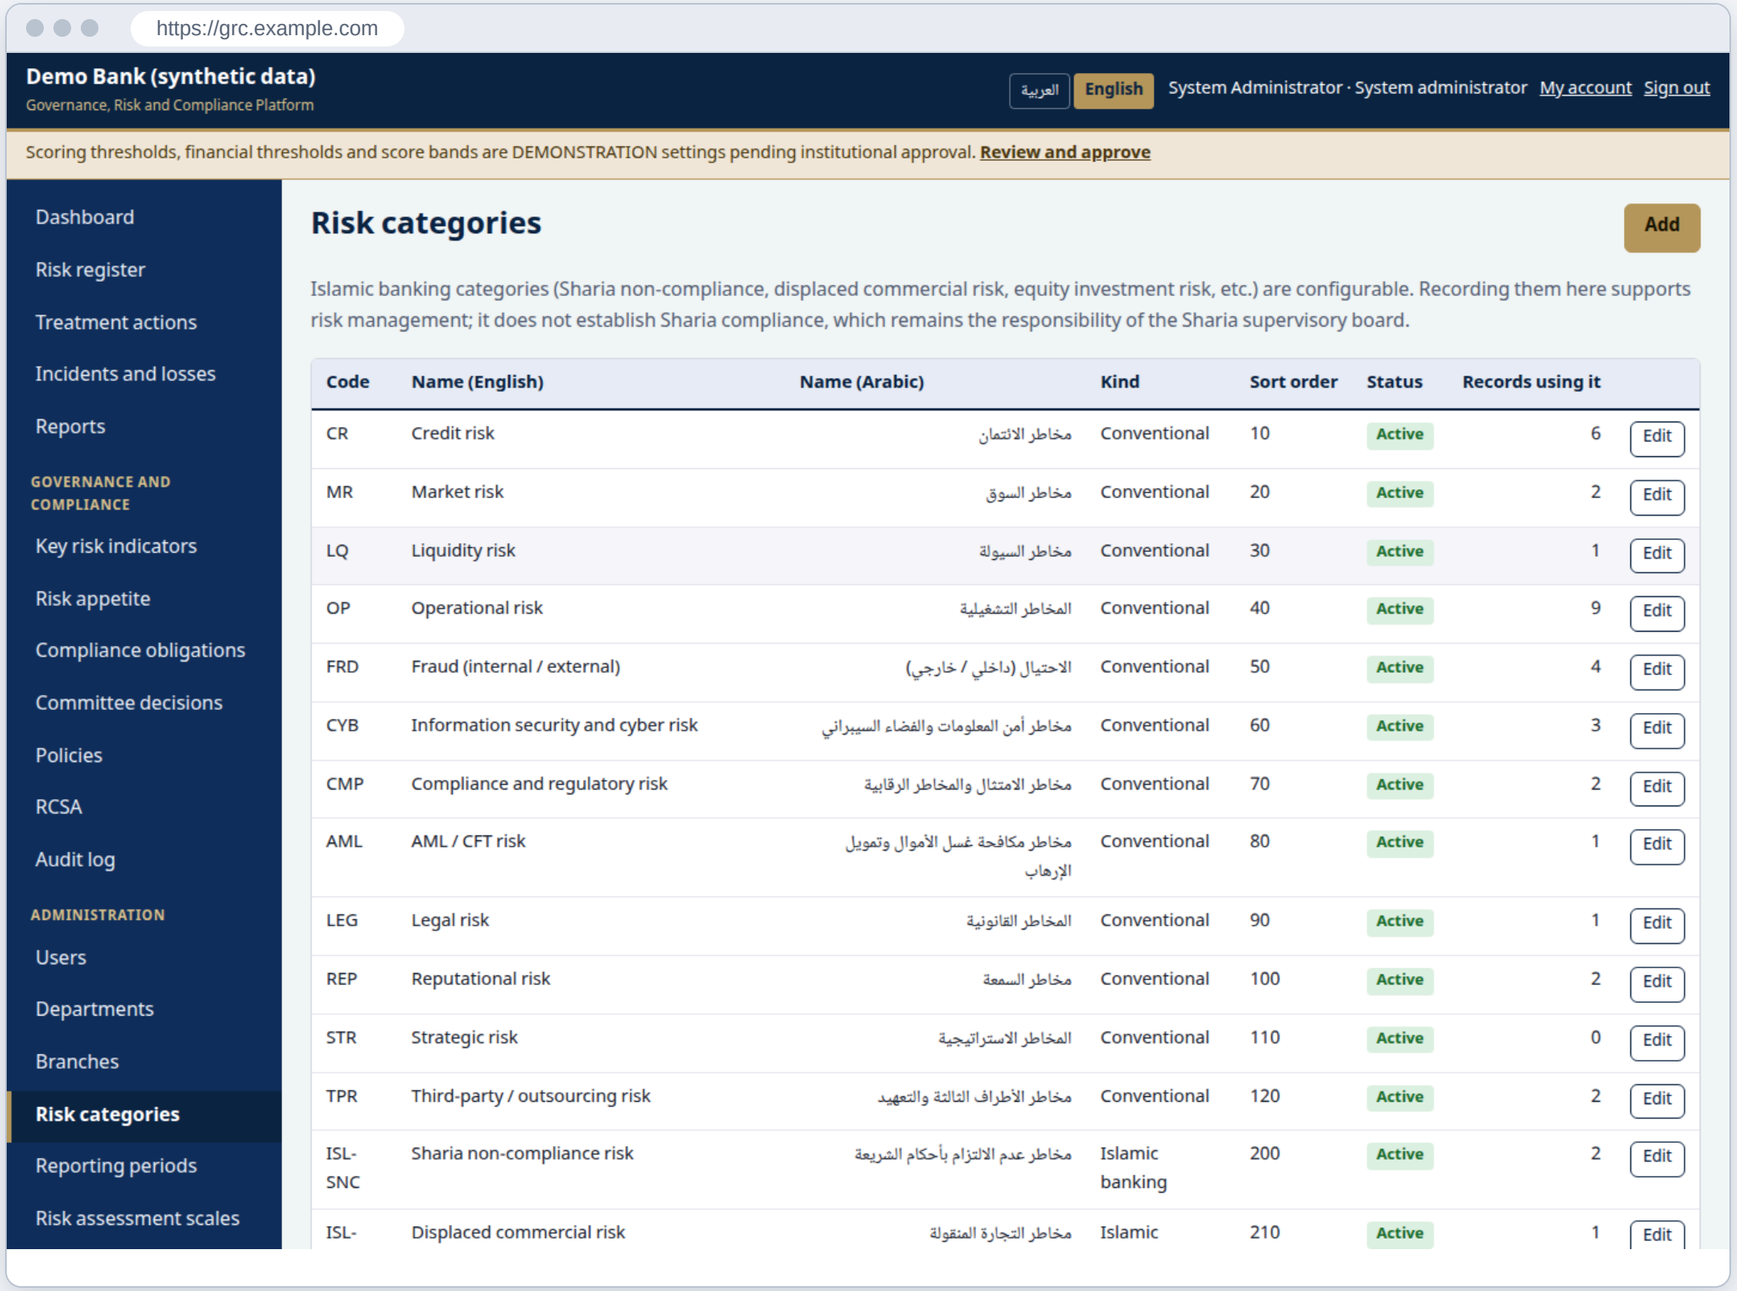

Configurable risk categories, including Islamic banking ones: Sharia non-compliance, displaced commercial risk, equity investment risk and more.

How to use it

- Add categories and set kind (conventional/Islamic) and display order.
- Recording these categories supports risk management; it does not establish Sharia compliance, which remains with the Sharia supervisory board.

Permissions and notes

System administrator only.

What you see

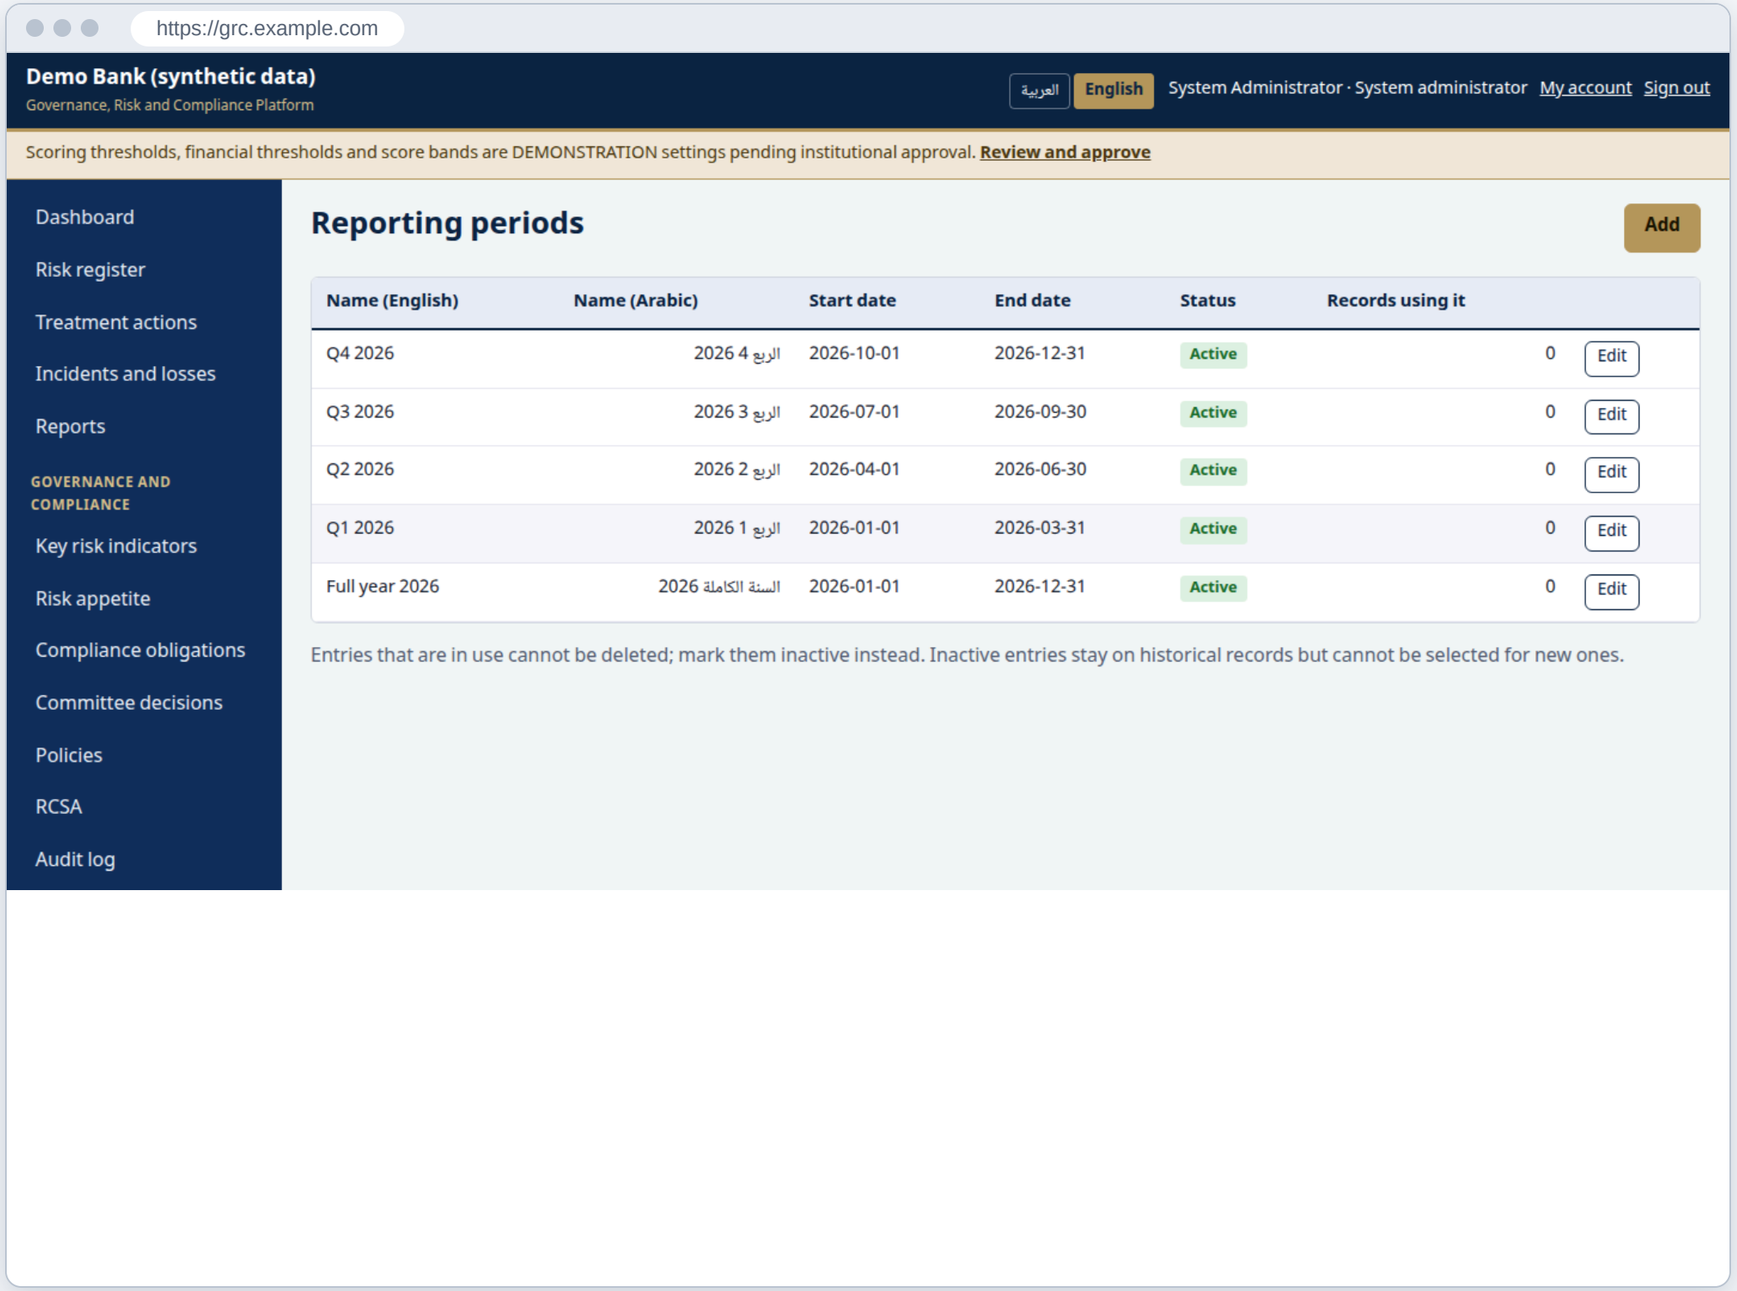

Reporting periods (quarters and year) used by the dashboard and KRIs.

How to use it

- Set start and end dates; the end cannot precede the start.
- Active periods appear in the dashboard period picker.

Permissions and notes

System administrator only.

Settings and currency

Administration

What you see

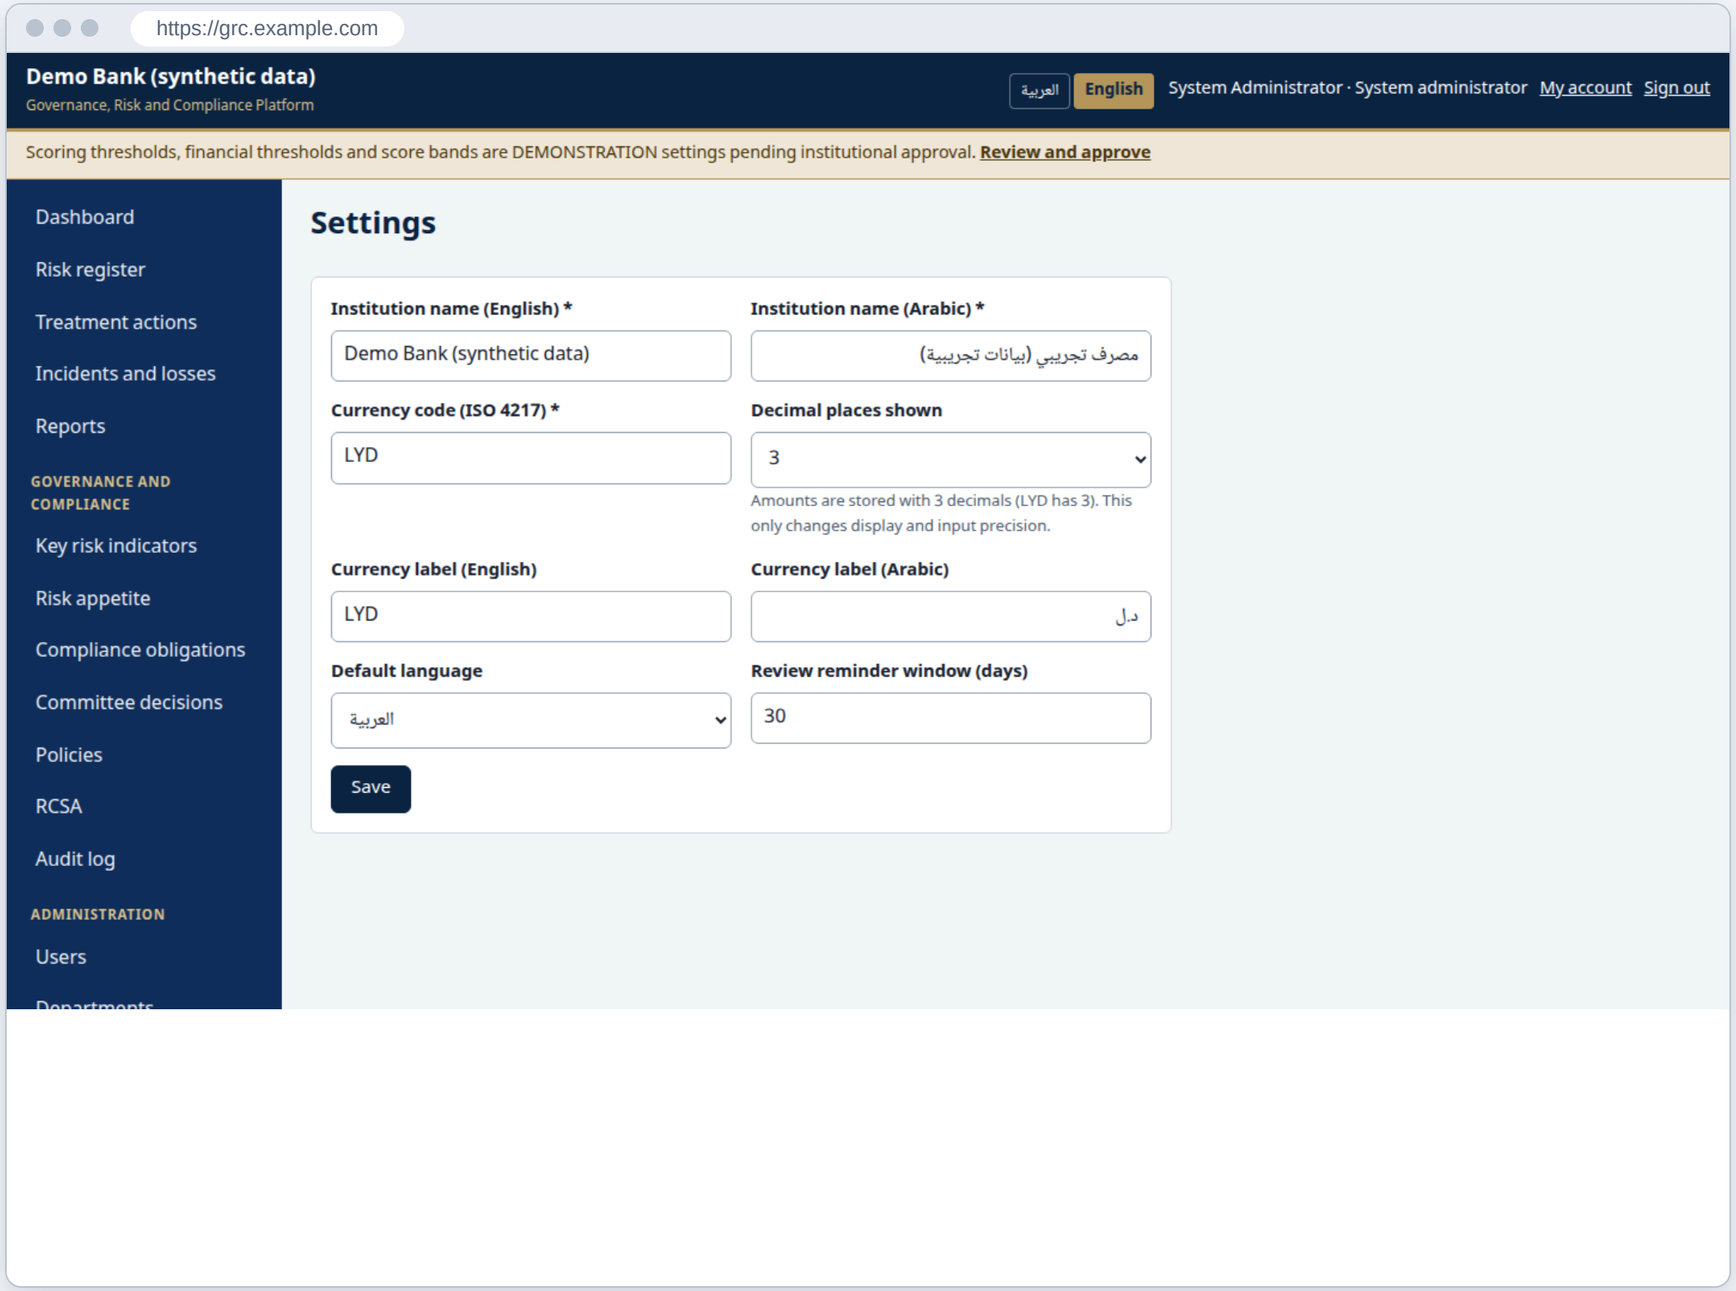

Institution name (Arabic/English), default currency (Libyan dinar, LYD) and decimals, default language.

How to use it

- Currency is configurable; amounts are stored with three decimals.
- The default language applies to users without a preference.

Permissions and notes

System administrator only.

What you see

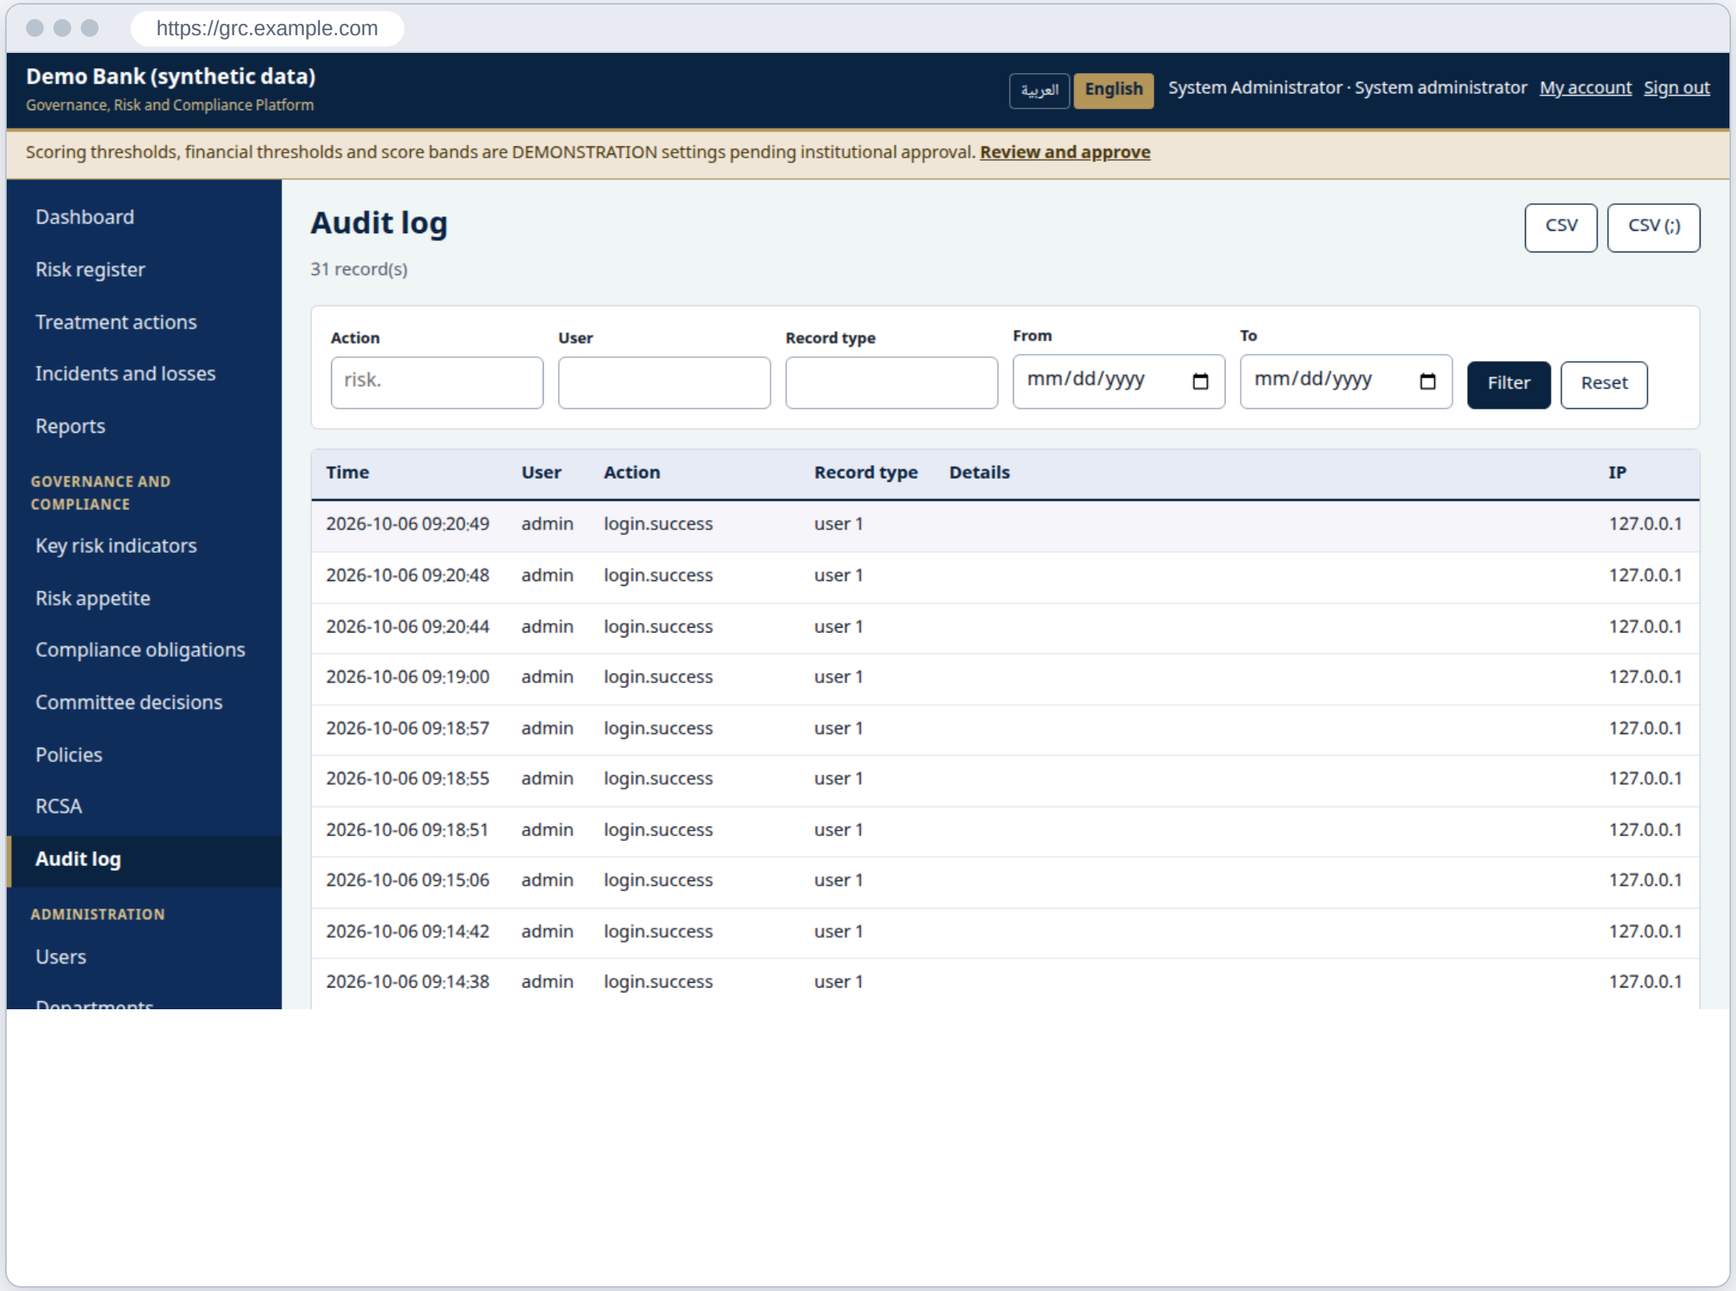

Log of significant actions: sign-ins and failures, record changes, exports and settings changes. It contains no passwords or secret tokens.

How to use it

- Filter by action, user or date and export CSV.

Permissions and notes

System administrator and auditor.

What you see

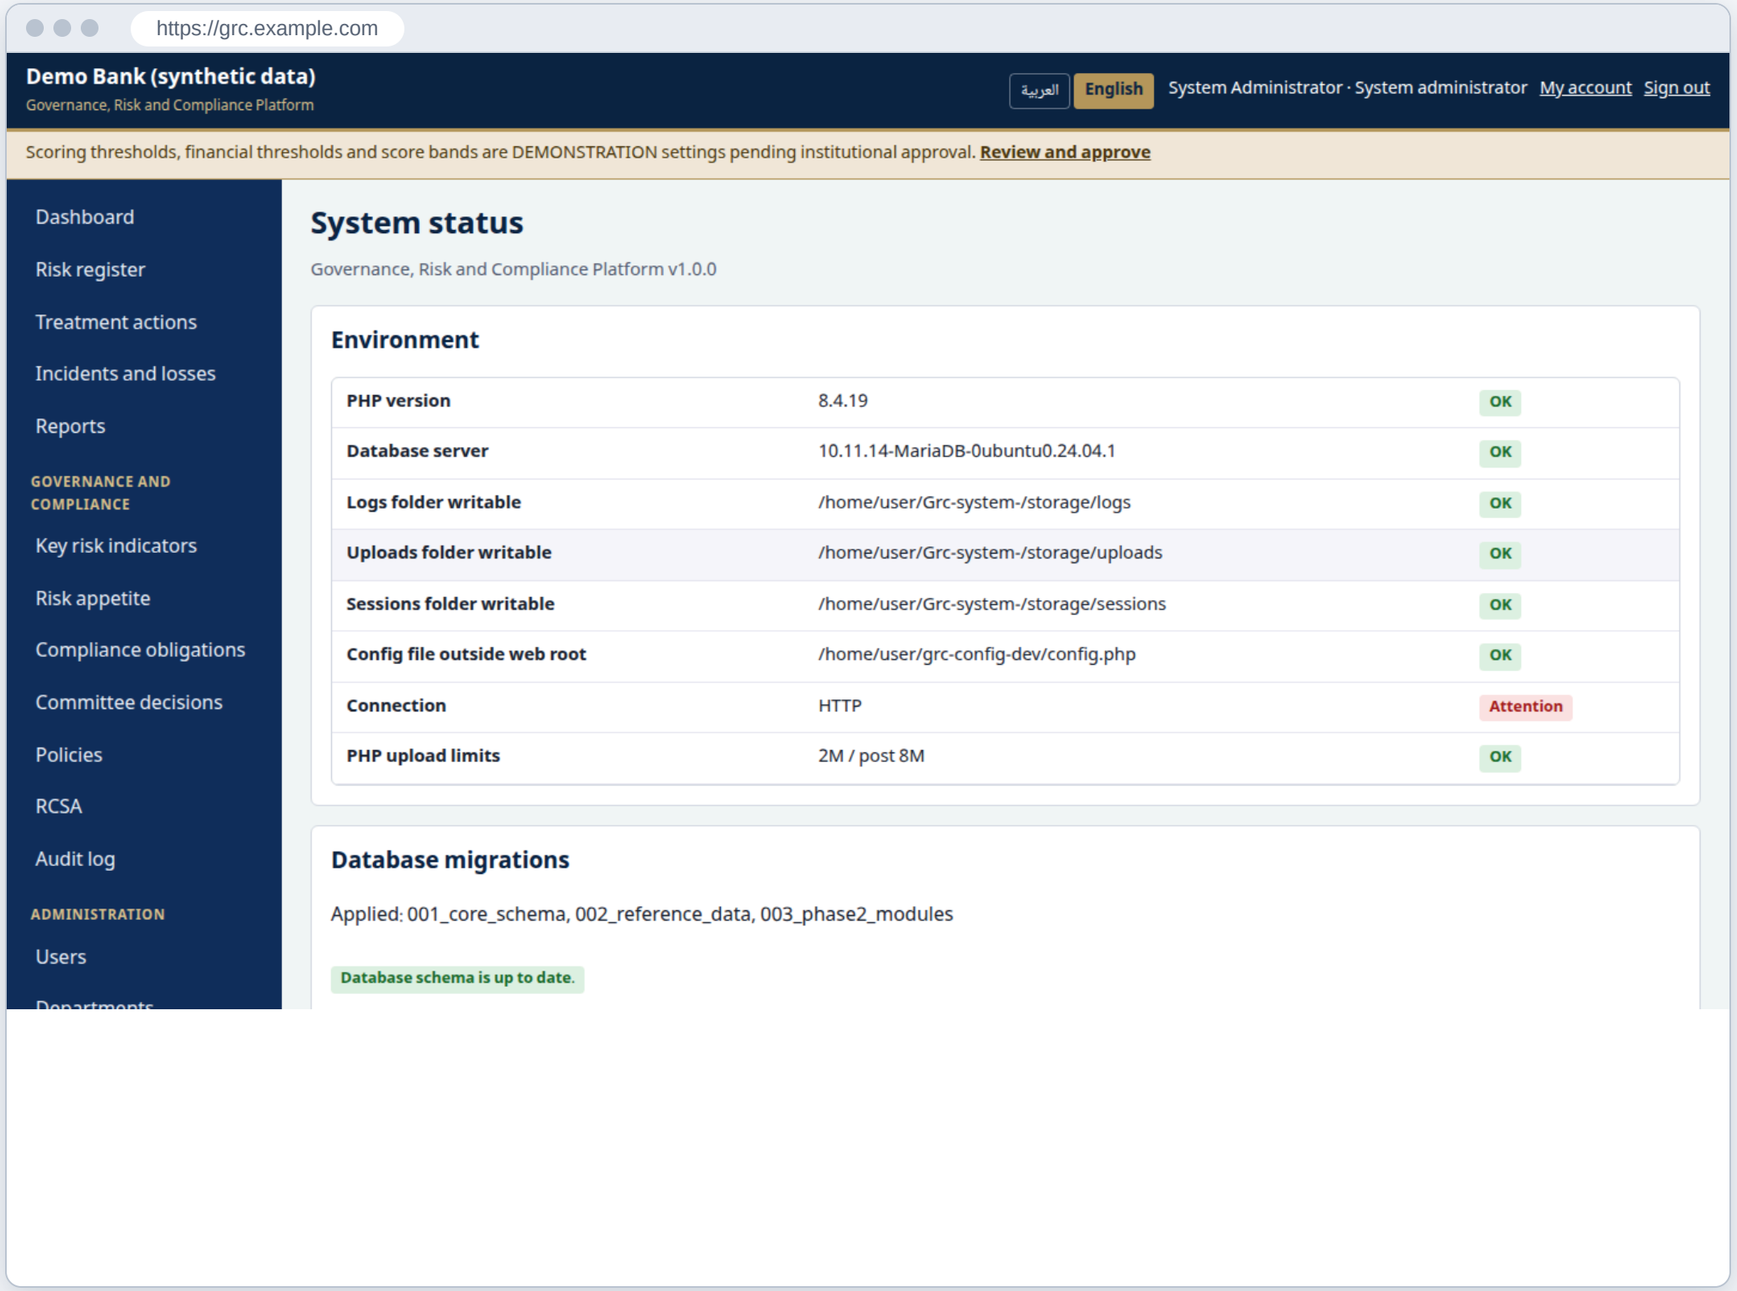

Environment checks (PHP, database, folder permissions, config file outside the web root) and database migrations for upgrades.

How to use it

- Take a backup before applying pending migrations.

Permissions and notes

System administrator only.

Main workflows

Create and assess a risk

Risk register → New risk → identification → inherent likelihood and impact → controls → residual assessment with rationale → Save → add a treatment action → attach evidence

Record an incident

Incidents → Report incident → dates, branch, category → gross loss and recoveries (net is calculated) → link a risk → Save

Executive follow-up

Dashboard → choose the period → click a heat-map cell or an “overdue” indicator → open the record → export CSV or print

Key risk indicator

KRIs → open an indicator → add a reading → if it leaves green it appears in alerts and on the dashboard

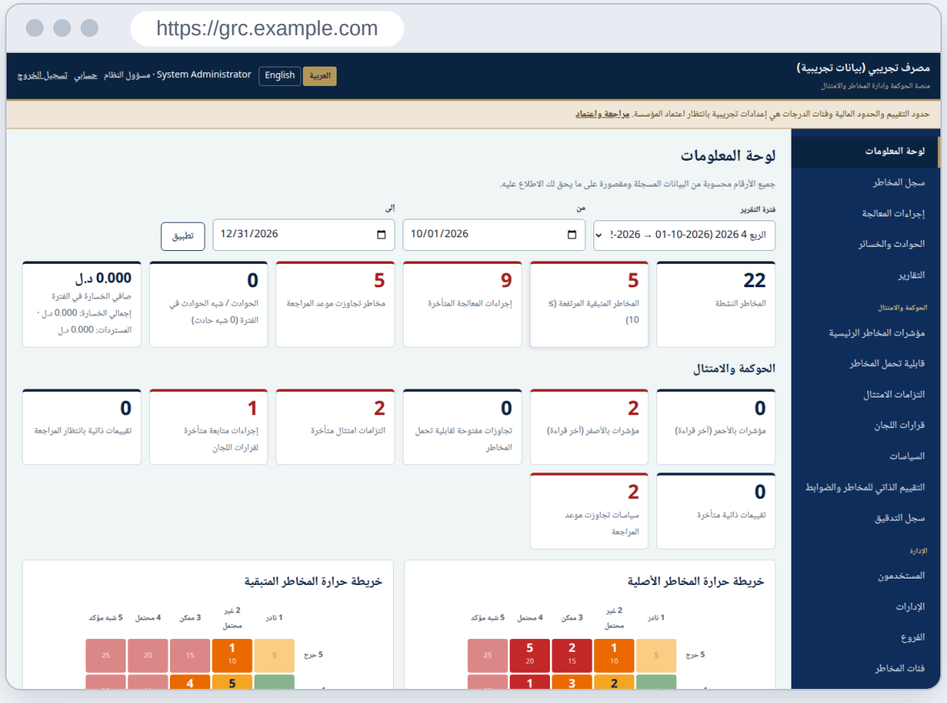

Appetite breach

Risk appetite → Evaluate now → open the breach → escalate → accept or resolve with a note

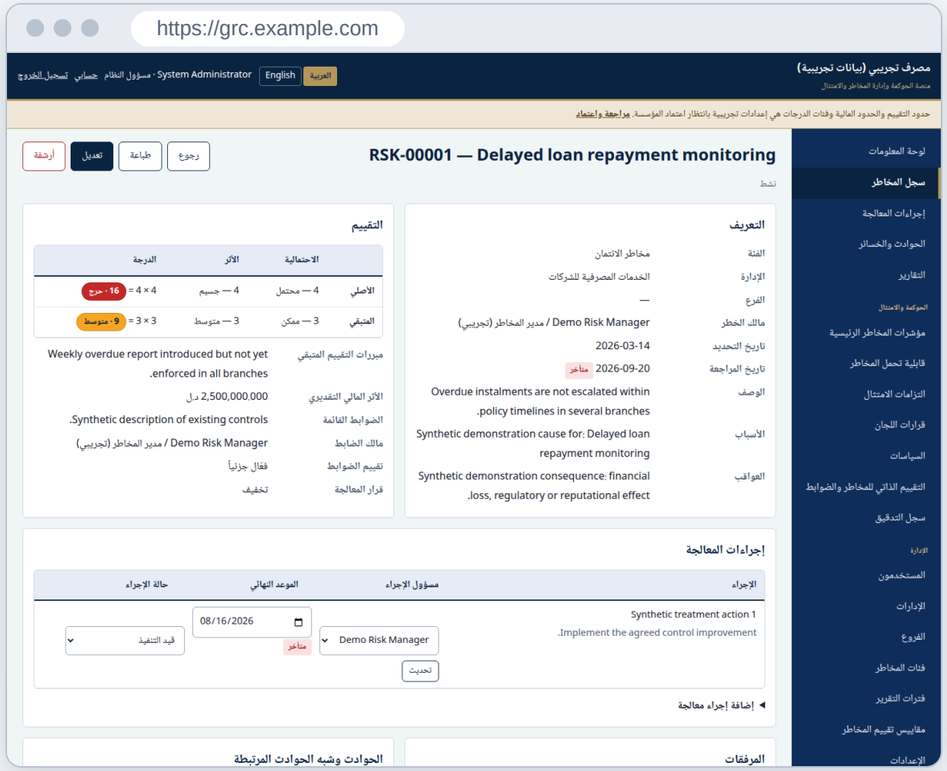

Self-assessment

Launch → department/branch → assessor completes and submits → reviewer approves or returns

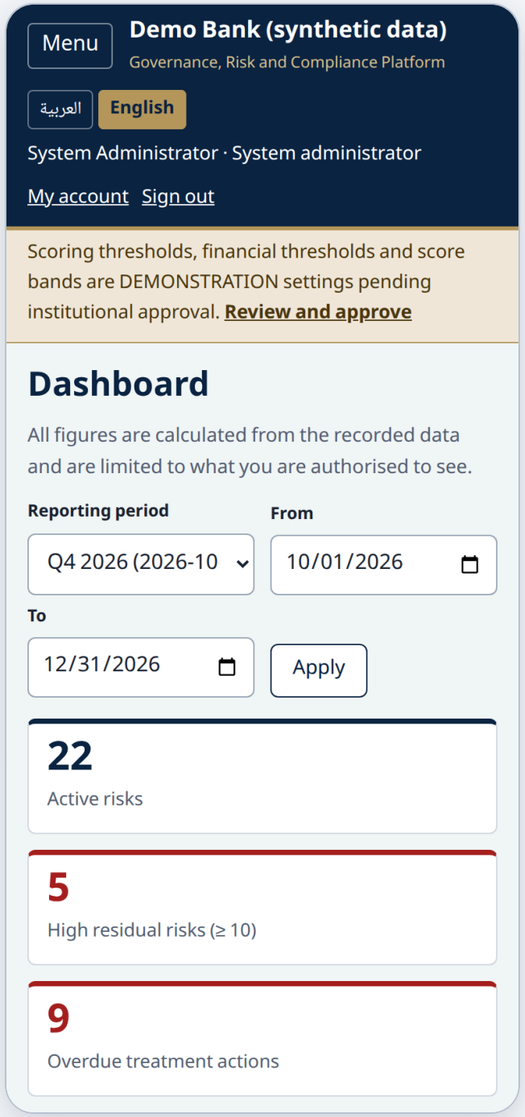

Arabic, English and mobile

Risk detail in Arabic

Mobile view (responsive)

Limits and verification

Verified

- 609 automated checks pass (authentication, permissions and scope, assessment, losses, totals vs the database, export, upload, translation, clean-database install, sub-directory deployment).
- A real-browser run of the main workflows on synthetic data.

Not verified

- Real Bluehost/cPanel deployment, Apache and the .htaccess files, HTTPS.
- PHP 8.1–8.3 and MySQL 5.7/8 (only PHP 8.4 and MariaDB 10.11 were exercised).
- Opening the CSV in Excel, screen readers and penetration testing; there is no security certification.
- The Arabic UI wording needs review by a banking professional before production.

Important notes

- Scoring thresholds, financial thresholds and score bands are **demonstration values** pending institutional approval.
- The software does not establish regulatory or Sharia compliance.
- All data in this workbook is synthetic.
